To suppose every soul to be but one physical minimum, or smallest *extensum*, is to imply such an essential difference in matter or extension as that some of the points thereof should be naturally devoid of all life, sense, and understanding, and others again sensitive and rational.

Situated or being outside; pertaining to or connected with that which is outside; outward; outlying; external: as, the *exterior* relations or possessions of a country; an *exterior* boundary or line of fortification. In mathematics applied to a position with reference to a surface in space such that from that position it would be possible to proceed by a continuous motion to infinity without crossing the surface. In like manner, on a surface a position is *exterior* to a contour if from that position it would be possible to move to the limit of the surface, or to infinity, without crossing the contour. Also, if a space, a surface, or a line be divided into three parts in such a manner that from the first it would not be possible to pass to the third without traversing the second, the first and third are said to be *exterior* to the second. Upon a closed surface, or curve, the term *exterior* can have only a modified meaning; the larger part is generally regarded as the *exterior*. When two lines are crossed by a third line eight angles are formed, and of these those that are outside of the space between the first two are termed *exterior*, although if another pair of the three lines is considered as the first pair other angles will be *exterior*.

In Latin, and in modern formations on Latin analogies, it is especially used—(a) as a preposition in composition with a noun, the preposition with its object noun forming a unitary phrase to which is then attached an adjective termination, as in *extraordinarius* (Latin *extraordinarius*), pertaining to or characterized by something beyond the usual order (*extra ordinem*); (b) as an adverb, in composition with a verb, as in *extravagant*. As a mere English prefix it is often a quasi adjective, and is often detached as an adjective proper. (See *extra*, *a.*) The compounds given below are chiefly of the first class (a), of the type *extra* + noun + adjective termination, as *extra-alimentary*; as the second and third elements usually exist also as a simple adjective, the etymology is obvious, and is not usually inserted.

exultet (ek-sul'tet), *n.* [*L. exultet*, *exultet*, 3d pers. sing. fut. ind. act. of *exultare*, *exultare*, leap up, exult: see *exult*.] In the Western Church since the fifth century or later, and in the Roman Catholic Church to the present day, the hymn sung by the deacon from the pulpit (formerly from the gospel ambo) at the benediction of the paschal taper on Holy Saturday or Easter eve. It begins with the words "Exultet jam angelica turba colorum" ('Let the angelic multitude of the heavens now rejoice'), and takes its name from the first word. In the middle ages the hymn *Exultet* was often written on a long roll of vellum and illuminated with pictures so placed as to be upside down to the deacon as he read the words, in order that, as he gradually unrolled it and let it fall outside the ambo, the pictures might be seen upright by the people. Such an *Exultet* roll was sometimes 12 feet long. The *Exultet* was anciently used in some churches on the vigil of Pentecost also. See *paschal*.

In some words, as *alley*, *money*, etc., it represents an earlier diphthong; in others the *e* is unhistorical, the termination being a mere orthographic variant of *-y* or *-ie*, as in *honey*, *donkey*, *monkey*, *whiskey*, etc., being referred, as a suffix, to the simple *-y* when attached to nouns ending in *y*, as in *clayey*, *skyey*, etc.

Skt. *√ aksh*, see. The word *eye* appears disguised in *dais-y* and *wind-ow*, q. v. See *ocular*, etc., *ophthalmia*, etc., *optic*, etc.] 1. The organ of vision; the physiological mechanism of the sense of sight; an anatomical arrangement of parts by which optical images may be formed; in general, any part of an animal body by means of which the faculty of vision is exercised, or the impact of the light-rays is sensed as a visual impression or optical image. In most of the higher animals, as nearly all vertebrates, the eye is developed as a very special sense-organ of great structural complexity and functional delicacy. But from the joint a few comparative anatomy say, eye is any part of an animal body which responds more readily than other parts to the special stimulus of light, or whose activity is specially excited by the impact of light-rays. Thus, an extremely rude eye in the form of a mere spot, often a pigment-spot sensitive to light, is common in low animals, as in infusorians, and may be situated anywhere on the body, and may be indefinitely multiplied in number. These rudiments of eyes are commonly described as *eye-spots*, *eye-points*, or *eye-spots*. (See *cut* under *Balanophorus*.) In various ctenophores and echinoderms organs apparently responsive to the action of light occur in various parts of the body and in varying numbers. Somewhat higher in the scale of evolution, eyes become unmistakable in structural character, however dim or uncertain their actual visual function may be, as in worms, snails, etc. But in some of the *Mollusca*, as cuttlefishes, eyes are highly specialized as visual organs of conspicuous character, comparable to those of vertebrates, though constructed on a different plan. In the vast assemblage of arthropods, as crustaceans, insects, proper, and arachnids, constituting a large majority of the animal kingdom, eyes as a rule are well developed under one or both of two main modifications, namely, the *simple eye* or *ocellus* and the *compound eye* or *oculus*. (See *compound eye*, below, and *cut* under *Jaia*.) Such eyes are usually only two, but may be four, six, or eight in number. These higher numbers of eyes occur chiefly in arachnids, as spiders. Crustaceans have normally a single pair, often mounted on movable eye-stalks or ophthalmites, which are modified limbs of one of the cephalic segments. (See *cut* under *stalk-eye*.) A few crustaceans have a single median eye. In vertebrates, where the eyes are normally never more nor fewer than one pair, these organs are received in special formations of the skull, the *sockets* or *orbits* of the eyes; and the eyes are usually further defended from accidental injury by various contrivances, as *eyelids*, *eyelashes*, and *eyebrows*. (See these words.) Other appendages of the eye namable among its "defenses" are the lacrymal apparatus, which secretes tears to moisten the organ, and the glandular structures (Meibomian follicles), which serve for its lubrication by secreting a greasy substance. The front of the eye has usually a special mucous membrane, the *conjunctiva*. The most essential or intimate parts of the organ of vision are contained in a globe or disk, the *eyeball* (which see), which is freely movable in its socket in the higher vertebrates, and rolled about by the action of various muscles, as the four recti and two obliqui of man and the choanoid muscle of some mammals. Externally the eyeball consists for the most part of a tough opaque membrane, the *sclerotic*; but in front, of a hard transparent structure, the *cornea*. These together are the outermost of three tunics or coats of the eye; the second tunic consists of the *choroid coat* and *ciliary processes* and the *iris*, and the third and innermost of the *retina*, the expanded end of the *optic nerve*, which enters the ball from behind and spreads out upon the choroid to a varying extent. The retina receives optical impressions focused upon it by the crystalline lens, which are transmitted by the optic nerve to the brain, where they are sensed as visual images. The hollow eyeball with its sev-

eral tunics forms a kind of camera filled with certain solid and fluid refractive media. Directly in the axis of vision in the interior of the ball is suspended a solid biconvex body, the *crystalline lens*, serving to bring rays of light to a focus on the retina. The lens, inclosed in its capsule, also divides the interior of the eye into two compartments. The larger rear compartment is filled with a glassy fluid, the

vitreous humor, inclosed in a delicate hyaloid membrane, which may also send prolongations through its substance. In front of the lens, between this structure and the cornea, the space is filled with a more watery fluid, the *aqueous humor*. This anterior space is partly divided into an anterior and a posterior chamber by the iris, which hangs in front of the lens like a curtain with a hole in the middle, the *pupil*. Besides the optic nerve, or special nerve of sight, the eye is supplied with other motor, sensory, and sympathetic nerves, and has its appropriate blood-vessels. In man both eyes look directly forward, their axes being parallel, though the orbits in which they are contained present a little outward, or away from each other. The optic nerve follows the axis of the orbit, and consequently pierces the eyeball behind, a little on the inner side—that is, toward the nose. The muscles which move the ball are six, the rectus superior, rectus inferior, rectus externus, rectus internus, obliquus superior, and obliquus inferior. These muscles are innervated by three motor nerves, the oculomotor, trochlear or pathetic (distributed to the obliquus superior), and abducent (distributed to the rectus externus). The ball is embedded in a quantity of adipose tissue forming a soft cushion, but is also somewhat isolated by means of a thin membranous sac called the *vaginal tunic* or sheath of the eye. The ball is nearly spherical or globular, but is a little deeper and wider across than from before backward, measuring about an inch in each of the former axes and $\frac{3}{8}$ of an inch in the latter. (For the structure of the several tunics, see *sclerotic*, *cornea*, *choroid*, *ciliary*, *iris*, and *retina*.) The retina is an expansion of the optic nerve into a large, circular, concavo-convex sheet, which rests upon the choroid with its inner surface in contact with the body of vitreous humor in the back of the eye. In the middle of it and in the axis of the eye is a little rounded elevation, the *yellow spot*, or *macula lutea*, with a depression at its summit, the *fovea centralis*. To the nasal side of the yellow spot is the entrance of the optic nerve and of the central retinal artery; and here the retina lacks the visual function which characterizes all the rest of its surface. The lens is suspended in a transparent capsule in the axis of vision: it is biconvex, and more convex on its posterior than on its anterior surface. It is about $\frac{1}{2}$ of an inch across and $\frac{1}{4}$ of an inch deep, and its structure presents concentric laminations. It tends to flatten with age. (See *crystalline lens*, under *crystalline*.) The vitreous humor fills the hollow of the eyeball behind the lens. It is a glassy or jelly-like substance, consisting chiefly of water, with a little saline and albuminous material, inclosed in a delicate hyaloid membrane continuous in front with the capsule and suspensory ligament of the lens, and behind resting upon the retina. Some prolongations of the hyaloid enter the substance of the humor, and one of these is called the *canal of Stilling*. The quantity of vitreous humor, or bulk of the vitreous body, is about $\frac{3}{4}$ of the entire mass of the eyeball. The aqueous humor is the slightly saline watery fluid which fills the eye in front of the lens, between this and the cornea, on both sides of the iris, consequently occupying the whole of the anterior and posterior chambers of the eye. Its bulk is very small. (See *conjunctiva*, *lacrymal*, *Meibomian*, *nasal*, *ocular*, *ophthalmic*, *optic*, *palpebral*, *superciliary*, *lacrimal*, etc.) The eye agrees with other sense-organs in development in the embryo, in being partly formed by the involution or evagination of a portion of epiblast from within, and partly by protrusion or evolution from within of a primitive ocular vesicle, the two coming together in the situation where the lens is to be developed. The result is that a portion of epiblast from the back of the embryo, which had been shut into the hollow of the cerebrospinal tube, pushes out from one of the cerebral vesicles to meet another portion of epiblast from the face of the embryo. Thus, the retina and associate parts are an outgrowth from

Thus, the retina and associate parts are an outgrowth from

the undeveloped brain, while the lens and associate epithelial structures are an ingrowth of epidermis. In other mammals with well-formed eyes the structure is substantially the same as in man, though minor and incidental variations are numerous. The eyes of quadrupeds usually present laterally, and not directly forward. They are usually relatively larger and probably much more effective organs of vision than those of man. They frequently develop a special choanoid muscle or retractor of the eyeball. The iris is commonly black, brown, or of some dark tint, seldom bluish or pale. It often contracts in such a way that the pupil is linear, elliptical, or narrowly oval, instead of circular, as in man. This is well seen in the cat. In birds several modifications occur. The eyeball is strengthened and its shape molded by a set of splint-bones or small bony plates disposed in a circle in the sclerotic around the cornea. The ball is hemispherical with an anterior projection, somewhat like a short acorn in a large cup, and the cornea is very convex. The pupil is always circular, though the iris may be so motile as to present only a narrow ring round the pupil, or to reduce the pupil to a mere point. These changes are well seen in the eyes of owls. There is also in the vitreous humor a peculiar plaiting or folding of the choroid, called the *marasmus* or *pecten*. The visual range and power of the eye in some birds, if not in all, are much greater than in man. All birds have three eyelids, the third very fully developed and arranged so as to sweep entirely across the front of the eye by means of special muscles and tendons upon the back of the eyeball. No birds are eyeless. In reptiles the eyes are structurally more like those of birds than of mammals. Some reptiles are eyeless, or have very rudimentary eyes. Most have eyelids, but these are wanting in ophidians, a transparent cuticle being continued directly over the ball, and shed with the rest of the cuticle. In fishes the eyes are generally symmetrically lateral, but not infrequently dorsal and closely approximated to each other, and rarely inferior; in one type, the heterosomes or flat-fishes, they are, however, both on one side, that belonging to the side which rests on the ground being in the very young in the normal position, but soon actually penetrating through the integument, and with the circumocular cranial region twisting to the opposite side and assuming a permanent position above the regular eye of the colored or uppermost side. The accessories of the eyes of mammals are undeveloped in fishes, but the eyes themselves are sometimes covered by a fold of the integument, and sometimes, as in some sharks, by a peculiar nictitating membrane. Among the most characteristic features are the flattening of the cornea and the sphericity of the crystalline lens. In one group (*Anableps*) a remarkable deviation from all other forms occurs, in that the cornea is divided by a horizontal band of the conjunctiva into upper and lower halves, and two pupils are developed, the species consequently being known as four-eyed fishes. In the lowest of the vertebrates (*Branchiostoma*) the eye is represented by a very small spot, coated with dark pigment and receiving the end of a short nerve. See *vision*.

And in its eye more closely they come back. *Dryden.*

(g) In metal, an opening at the angle of the tuiere, or where the tuiere connects with the gooseneck, in a blast-furnace, through which the state of the interior may be examined. 12. In *Crustacea*, a calcareous concretion embedded in the walls of the stomach. These concretions are supposed, but not known, to furnish a supply of calcareous substance for the formation of the new shell after a molt; but they are so small that this theory is hardly tenable. In the case of the higher crustaceans they are more fully called *eye-balls*. (See *crab*.) In the crawfish they are two discoidal plates in the middle of the lateral surface of the walls of the anterior dilated portion of the cardiac division of the stomach, and weigh about two grains. They begin as calcareous deposits underneath the chitinous gastric lining, and increase until the creature molts, when they are also shed, together with the lining membrane and gastric armature.—A or the green eye, jealousy: from the poetic description of jealousy as the green-eyed monster.—All my eye, or all in one's eye, entirely in the eye or mind; seeming; apparent, but not real. anatomical purposes are constructed of wax or papier maché. For use as substitutes for lost human eyes they are made of glass or porcelain. The chief use of artificial eyes, however, is for filling the sockets of stuffed animals. The simplest are small black glass beads or buttons mounted on a bit of fine wire. Larger eyes are more elaborately made of various shapes, with a close imitation in color of the iris or shape of the pupil.—At eye, at a glance.

The gold of hem hath now so hadde alayes
With bras, that though the coyne be faire at yé,
It wolde rather brest atwo than plye. *Chaucer, Clerk's Tale, l. 1168.*

Chambers of the eye. *See chamber.*—**Compound eyes,** in insects, simple eyes or ocelli set so close together that their several corneas are in contact, and pressed into tetragonal or hexagonal figures with slightly convex surfaces, giving the eye a faceted appearance, whence the name *faceted eyes*. Each cornea then answers to one of the faces of a cut brilliant. Behind such a cornea, instead of a lens, is placed a transparent pyramid whose base corresponds to the cornea, and whose apex is directed inward to be received into a kind of transparent calyx answering to a vitreous body. This last is surrounded by another calyx formed by the expansion of a new filament arising from a ganglion on the end of the optic nerve, a short distance from the brain. Each lens-like pyramid, with its vitreous body and nerve-filament, is surrounded by a choroid coat, usually of a brown color. The size and shape of compound eyes, and especially the number of their facets, are very variable. Different facets of the same eye also vary in size.—**Crab's eye.** *See def. 12.*—**Dorsal eye.** *See dorsal.*—**Evil eye.** *See evil.*—**Eye-and-ear observation,** in astron., an observation of the time of passage of a star across a wire, made in the following way: The observer, having his eye at the telescope, listens to the beats of a clock, and notes where the star is at the beat immediately preceding the passage, and where it is at the next following beat. He mentally divides the space run over in this second into tenths, and by estimating in what part of it the wire lies, he determines the time of the passage to a tenth of a second.

The method of eye-and-ear observation . . . is so called from the part which both the eye and the ear play in the appreciation of intervals of time. The ear catches the beat of the clock, the eye fixes the star. *Newcomb and Holden, Astron., p. 79.*

Same as *compound eyes* (which see, above).—**Flemish eye,** a ring formed in a rope's end, by separating the strands into two parts, joining their ends, and wrapping the loop so formed with tarred canvas and service.—**Half an eye,** imperfect perception; limited observation, as if with a mere glance of the eye: as, that can be seen with half an eye.—**Lashing-eye,** an eye formed on the end or ends of a rope, for a lashing to be rove through, to set it tight.—**Sheep's eyes.** *See sheep.*—**Simple eye,** in entom., an ocellus or stemma. (See *def. 1*, and cut under *falx*.) In arachnids the eyes are always simple, and have the same structure as those of crustaceans. These eyes are two, four, six, or eight in number, and seldom lacking.

Their disposition in sets or groups, or singly, and especially when they are numerous, as six or eight, often furnish important characters in classification, as in spiders.—**Spliced eye.** *See eye-splice.*—**The eyes of a ship,** the eyes of her (naut.), the foremost part in the bows of a ship. It was the custom in ancient Greece to represent an eye at either side of a boat's prow (see cut under *embolon*); so at one time in Britain; and in Spanish and Italian boats and Chinese junks the practice still obtains. The hawse-holes are also called the eyes.—**The mind's eye,** intellectual sight or perception; the faculty of mental comprehension.

They are numerous and well marked in all birds, many reptiles, etc. *See eye¹.*

(See cut under *skull*.) The projection, however, is slight in comparison with the beeting superorbital ridges of many animals, as the gorilla. In birds, and in many reptiles and fishes, the eyebrow is a separate formation of a bone, or chain of bones, along the upper edge of the orbit, whose nature is that of the lacrymal bone. These are known as superorbitals, or superorbital bones or ossicles. (See cut under *Lepidosiren*.) One such bone forms the movable superciliary shield of some birds, as eagles, projecting like the eaves of a roof over the eye. Eye-glasses are either single, and held between the projection of the brow and the cheek, or double, and kept in position by a spring, which compresses the nose. It serves the purposes of protecting and wiping the ball of the eye, as well as of moistening it by spreading the lacrymal fluid over its surface. Eyelids occur in mammals, birds, most reptiles, and *Amphibia*, not in *Ophidia* and true fishes. They are generally two in number, upper and lower, formed of ordinary skin and a layer of conjunctiva, stiffened or not with cartilage, and furnished with appropriate muscles, glands, etc.; they are technically called *palpebræ*. Some animals, as birds, have a third eyelid, the nictitating membrane, a fold of conjunctiva capable of being swept obliquely across the front of the eyeball; some mammals possess it imperfectly de-

veloped, as the horse. A similar structure defends the eye of some sharks, though seldom called eyelid. Serpents have no proper eyelids, because the cuticle continues unbroken over the eyeball. See cut under *eyel*.

2. The regular establishment of this system dates from 1176 (22 Hen. II.), and it gave place to substantially the present system of assize and nisi prius, under 13 Edw. I., c. 30. It seems that in the earlier periods, when these justices were empowered to levy royal revenues, remonstrances of the people led to a concession that they should make the circuit only once in seven years. Later, when the judicial function became more important, they were directed by Magna Charta to visit every county once a year.

out of use in the alphabet generally known to us as Greek. The Phœnician character had the name *vav* or *waw* (meaning 'peg' or 'hook'), and its value was that of our English *w*. This same value it had in primitive Greek use, and it is found so used in western inscriptions, although lost too early to appear in eastern inscriptions. The sound, namely *w*, went gradually out of use in Greek, and its sign went with it. Since the latter somewhat resembled in form one gamma (Γ) written above another, the Greek grammarians gave it the fanciful name of *digamma* or *double gamma*, by which therefore we generally call it as a Greek letter. The comparative scheme of forms (compare *A*) is as follows:

In the adaptation of the alphabet to Latin use the sign first received the value we give it, since the *f*-sound occurred in Latin and needed a representative; the *w*-sound was provided for by being written with the same character as *u*. (See *U* and *V*.) The sound *f*, as we pronounce it, is a surd (or breathless) labiodental, a fricative sound or spirant; that is to say, it is made by the audible friction or rustling of the unintonated breath, when forced out between the edge of the lower lip and the tips of the upper teeth, these being held in contact with one another. If, everything else remaining the same, the intonated breath be forced out instead, the sound is *v* (as in *valve*, *vioid*); hence, *f* and *v* are corresponding surd and sonant. An *f*, nearly identical with ours in audible character, may also be made between the edges of the two lips alone, without any help from the teeth; and such a purely labial *f* is heard in many languages, and is with probability to be regarded as more primitive than the labiodental *f*, and as forming the transition to it, in the languages where the latter prevails. The same sound is also widely represented in English by *ph*, but almost only in words coming from the Greek; it also exists in some words written with *gh*, as *laugh*, *cough*, *clough*, *rough*, *tough*, etc., the labial aspirant having taken in such words the place of the palatal, such change being recognized in the spelling in only a few words, as *dwaff*, *draught*, *duff* (= *dough*, as formerly pronounced), etc. Historically, *f* stands in general for a more original *p*, as found in Sanskrit and the classical languages: thus, *father* for *pitar*, *pater*, etc.

Thus the letter *F* is derived from the Hieroglyphic picture of the cerastes, or horned Egyptian asp.

Isaac Taylor, *The Alphabet*, I. 12.

2. A real state of things, as distinguished from a statement or belief; that in the real world agreement or disagreement with which makes a proposition true or false; a real inherence of an attribute in a substance, corresponding to the relation between the predicate and the subject of a proposition. By a few writers things in the concrete and the universe in its entirety are spoken of as *facts*; but according to the almost universal acceptance, a *fact* is not the whole concrete reality in any case, but an abstract element of the reality. Thus, Julius Caesar is not called a *fact*; but that Julius Caesar invaded Britain is said to have been a *fact*, or to be a *fact*. To this extent, the use of the word *fact* implies the reality of abstractions.

With the majority of writers, also, a *fact*, or *single fact*, relates only to an individual thing or individual set of things. Thus, that Brutus killed Caesar is said to have been a *fact*; but that all men are mortal is not called a *fact*, but a *collection of facts*. By *fact* is also often meant a true statement, a truth, or truth in general; but this seems to be a mere inexactness of language, and in many passages any attempt to distinguish between the meanings on the supposition that *fact* means a true statement, and on the supposition that it means the real relation signified by a true statement would be empty subtlety. *Fact* is often used as correlative to *theory*, to denote that which is certain or well settled—the phenomena which the theory colligates and harmonizes. *Fact*, as being special, is sometimes opposed to *truth*, as being universal; and in such cases there is an implication that *facts* are minute matters ascertained by research, and often inferior in their importance for the formation of general opinions, or for the general description of phenomena, to other matters which are of familiar experience.

I am wounded

In fact, no man words cure it.

Fletcher (and another), Elder Brother, iv. 1.

Sheridan, Speech in Reply to Mr. Dundas.

In order to believe that gold is yellow, I must, indeed, have the idea of gold, and the idea of yellow, and something having reference to these ideas must take place in my mind; but my belief has not reference to the ideas, it has reference to the things. What I believe is a *fact* relating to the outward thing, gold, and to the impressions made by that outward thing upon the human organs; not a *fact* relating to my conception of gold, which would be a *fact* in my mental history, not a *fact* of external nature.

J. S. Mill, Logic, I. v. § 1.

The basis of all scientific explanation consists in assimilating a *fact* to some other *fact* or *facts*.

3. In *law*, an actual or alleged physical or mental event or existence, as distinguished from a legal effect or consequence: as in the phrases *matter of fact*, *question of fact*, *the facts of the case*, as distinguished from *matter of law*, *question of law*, *the law of the case*. Thus, whether certain words were spoken is a question of *fact*; whether, if spoken, they constituted a binding promise, is usually a question of *law*.—**Abliative fact**, a fact which according to law takes away a right.—**Collateral facts**. See *collateral*.—**Collative fact**, a fact appointed by law to give commencement to a right.—**Conclusion of fact**. See *conclusion*.—**Divestitive fact**. 3. In *Rom. antiq.*, one of the classes into which the charioteers in the circensian games were divided, one of each contending in a race. The four regular *factions*, distinguished by their dresses as the green, red, blue, and white, represented spring, summer, autumn, and winter. Domitian added purple and yellow *factions*, making six contestants in every race; but these new divisions were not permanent. A dispute in Constantinople, in 532, between the green and blue *factions* and their partizans, the emperor Justinian favoring the latter, led to a civil war of five days, which cost 30,000 lives and nearly overthrew the government.

Their trains must bate,

The adjunct predicated of the object is called a *factitive* or *objective predicate* (sometimes, less correctly, a *factitive object*).

For instance, in certain branches of this stock, as the Persian, etc., . . . the tendency of causal verbs to lose their force altogether, even with the longer *factitive* form, which they faithfully keep, is only the breaking through of that principle which asserted itself almost universally in the late analytic state of the group.

=*Syn. 2. Fairy, Elf, Fay; Sylph, Gnome; Jinn, Genie; Goblin.* Fairy is the most general name for a diminutive imaginary being, generally in human form, sometimes very benevolent or inclined to teach moral lessons, as the fairy godmother of Cinderella; sometimes malevolent in the extreme, as in many fairy stories. *Spenser* took up the word in Chaucer's spelling, *faerie* or *faery*, and gave it an extended meaning, which is now commonly confined to that spelling and to his poem; the personages in "The Faery Queen" live in an unlocated region, essentially like the rest of the world, and are of heroic and occasionally supernatural powers; these personages he sometimes calls *elves* or *elfins*. In ordinary use an *elf* differs from a *fairy* only in generally seeming young, and being more often mischievous. *Pope*, in "The Rape of the Lock," has given a definite cast to *sylph* and *gnome*; these two words are elsewhere often associated, *gnomes* having always been fabled as living in underground abodes, and especially as being the guardians of mines and quarries, while *sylphs* are denizens of the air. From this difference of place it has followed that *gnomes* are generally thought of with repugnance or dread, and *sylphs*, although of both sexes in literature, are popularly thought of as young, slender, and graceful females; hence the expression "a sylph-like form." To Oriental imagination is due the *jinn*, *djinn*, or *finnee*; the form *genie* is most vividly associated with the "Arabian Nights": as, the *genie* of Aladdin's lamp; the *genie* that the fisherman let out of the bottle. A *goblin* is wicked, mischievous, or at least roguish, and frightful or grotesque in appearance. See the definitions of *kobold*, *sylph*, *brovante*, *banesee*, *epriede*, *pixie*, *nixie*, *nymph*, etc.

Fairy pipes, pipes and pipe-bowls, usually of baked clay and very small, found in the north of England, sometimes with objects of remote antiquity. Falco (fal'kô), *n.* [*LL.*, a falcon: see *falcon*.] A genus of diurnal birds of prey. It was formerly continuous with the family *Falconidae*, but is now usually restricted to species which have the beak toothed,

falcon (fă'kn or fal'kon), *n.* [The present spelling is an alteration, to bring the form near the *L.*; early mod. *E. faucon, faucon*, etc.; < *ME. faucon, faukon, faukon, faukon, faucon*, < *OF. faucon, faucon*, later *faucon*, mod. *faucon* = *Pr. faucon, falc* = *OSP. falcon*, *Sp. halcon* = *Pg. falcão* = *It. falcone* = *OHG. falcho, G. falke* = *D. valk* = *Leel. falks* = *Sw. A diurnal bird of prey, not a vulture; especially, a hawk used in falconry.

The birds used in hawking belong to one of two groups: (a) Falcons proper in an ornithological sense (see def. 2 (c)), belonging to the restricted genus *Falco*, of which the peregrine is the type. These birds rise above the quarry and stoop to it by dashing down on high; they are most highly esteemed for hawking, and called *noble*. (b) Hawks of the genus *Astur*, as the goshawk or falcon-gentle, which are quite differently shaped as to proportions of the wings, tail, and feet, and have consequently a different mode of flight. They capture the quarry by direct chase after it, and are called *ignoble*—a term somewhat loosely extended to other birds of prey which cannot be trained to the chase at all. In heraldry the falcon is generally represented with bells on the legs, but it is necessary to mention in the blazon the bells and their tincture. It is always supposed to be *close* unless the attitude is mentioned in the blazon. Where the falcon is described as *jessed* and *belled*, the jesses are represented as hanging loose.

Falconidae (fal-kōn'i-dē), *n. pl.* [NL., < *Falco* (*n.*) + *-idae*.] The most highly organized and raptorial family of diurnal birds of prey. It is now usually held to cover nearly all diurnal birds of prey, and to be nearly continuous with the suborder *Accipitres*, containing the old-world (not the new-world) vultures, as well as all kinds of hawks, falcons, buzzards, eagles, etc., except, usually, the secretary-birds and the ospreys or fish-hawks. The vultures or carrion-feeding birds of prey of the old world were formerly excluded from the limits of this family, but are now brought under it. The characters of the group are nearly the same as those of the suborder *Accipitres*. The family is variously subdivided, a usual division being into *Falconinae*, falcons; *Polyborinae*, caracaras; *Circiinae*, harriers; *Accipitrinae*, hawks; *Milvinae*, kites; *Buteoninae*, buzzard-hawks; and *Vulturinae*, old-world vultures, when these are brought under *Falconidae*. The doctrine of the fall is the doctrine that the first parents of the race were created without sin, but by voluntary transgression of God's law fell from the state of innocence, and that in consequence all their descendants have become guilty and amenable to divine condemnation and punishment.

Though Scripture gives no definition of the idea of sin, it leaves no elements of the doctrine of sin unexplored, but gives a full account of how sin penetrated into human nature by the fall of man. Schaff and Herzog, Encyc., p. 2186.

Specifically—2. A false syllogism; an invalid argumentation; a proposed reasoning which, professing to deduce a necessary conclusion, reaches one which may be false though the premises are true, or which, professing to be probable, infers something that is really not probable, or wants the kind of probability assigned to it. A fallacy is either a *sophism* or a *paralogism*, according as the deceit is intentional or not. But the word *paralogism* is also used to signify a purely logical fallacy—that is, a formal fallacy, or a direct violation of the canons of syllogism. Logicians enumerate as many different kinds of formal fallacy as they give of canons of syllogism, from four to eight. See below.

No man was less likely to be imposed upon by fallacies in argument, or by exaggerated statements of fact.

Macaulay, Boswell's Johnson.

The lazy belief that of none unspecified way things will so adjust themselves as to prevent the natural consequences of a wrong or foolish act is a very common fallacy.

J. Fiske, Evolutionist, p. 221.

A fallacy is used to mean: (1) A piece of false reasoning, in the narrower sense; either an invalid immediate inference, or an invalid syllogism; a supposed equivalent form which is not equivalent, or a syllogism that breaks one of the rules. (2) A piece of false reasoning, in the wider sense; whereby from true facts a false conclusion is inferred. (3) A false belief, whether due to correct reasoning from untrue premises (reasons or sources) or to incorrect reasoning from true ones. (4) Any mental confusion whatever.

A. Sidgwick, Fallacies.

Fallacies in things, according to the old logicians, fallacies that are not in words. They are of seven kinds: (1) The fallacy of accident, arising when a syllogism is made to conclude that, because a given predicate may be truly affirmed of a given subject, the same predicate may be truly affirmed respecting all the accidents of that subject. (2) The fallacy of speech respective and speech absolute, occurring when a proposition is affirmed with a qualification or limitation in the premises, but virtually without the qualification in the conclusion. (3) The fallacy of irrelevant conclusion, or *ignoratio of the elench*, occurring when the disputant, professing to contradict the thesis, advances another proposition which contradicts it in appearance but not in reality. (4) The fallacy of the consequent, or *non sequitur*, an argument from consequent to antecedent, which may really be a good probable argument. (5) *Begging the question*, or the *petitio principii*, a syllogism, valid in itself, but in which that is affirmed as a premise which no man who doubts the conclusion would admit. (6) The fallacy of false cause, arising when, in making a *reductio ad absurdum*, besides the proposition to be refuted, some other false premise is introduced. (7) The fallacy of many interrogations in which two or more questions are so proposed that they appear to be but one: as, "Have you lost your horns?" a question which implies that you had horns.—**Fallacies of composition and division**, fallacies which arise when, in the same syllogism, words are employed at one time collectively, and at another distributively, so that what is true in connection is inferred to be also true in separation, or the reverse.—**Fallacy of accent**, a fallacy arising from the mode of pronouncing a word.—**Fallacy of amphibology**, a fallacy arising from the doubtful construction of a sentence.—**Fallacy of an illicit process**, a false syllogism in which a term enters into the conclusion with a different distribution from what it had in the premise.—**Fallacy of equivocation**, a fallacy arising from the double meaning

of a word.—**Fallacy of figure of speech**, a fallacy arising from a tropical use of language.—**Fallacy of homonymy**, a fallacy arising from the double meaning of a single word.—**Fallacy of illicit particularity**, a syllogism in which the degree of particularity of the conclusion is different from the sum of those of the premises. See *particularity*.—**Fallacy of no middle**, a false syllogism in which the premises have no term in common that is dropped from the conclusion.—**Fallacy of undistributed middle**, a syllogism in which the middle term is undistributed in both premises: as, He who says that you are an animal speaks truly; he who says that you are a goose says that you are an animal; therefore, he who says that you are a goose speaks truly.—**Fallacy of unreal middle**, a fallacy which fails to assert the existence of any object of the kind denoted by the middle term: as, Pegasus was a horse, and Pegasus had wings; therefore, some horse has had wings.—**Semilogical fallacy, or fallacy in words**, a fallacy which deceives by some defect of language, and ceases to do so when the meaning of the propositions is strictly analyzed.

dhāman, an abode, house, < √ *dhā*, set, place, = Gr. *ti-ti-vai* = E. *do!*: see *do!*, and cf. *fact.*] *I. n.*; *pl. families* (-liz). 1. The collective body of persons who form one household under one head and one domestic government, including parents, children, and servants, and as sometimes used even lodgers or boarders. In law husband and wife living together, and having no children, are sometimes deemed within the benefit of a statute as to families.

B. Jonson, Staple of News, II. 1.

The two societies, Roman and Hindoo, . . . are seen to be formed, at what for practical purposes is the earliest stage of their history, by the multiplication of a particular unit or group, the Patriarchal *Family*. . . . The group consists of animate and inanimate property, of wife, children, slaves, land, and goods, all held together by subjection to the despotic authority of the eldest male of the eldest ascending line, the father, the grandfather, or even more remote ancestor.

Maine, Early Hist. of Institutions, p. 810.

Families are the unity of which society is composed, as tissue is made of cells, and matter of molecules. J. F. Clarke, Self-Culture, p. 225.

2. Come they of noble *family*?

Why, so dist thou. Shak., Hen. V., II. 2.

3. In a narrow use, the children of the same parents, considered collectively apart from the parents: as, they (a husband and wife) have a large *family* to care for; a *family* of children. [In all the above uses, frequently used figuratively with regard to animals.]

Seldom at church (twas such a busy life), But duly sent his *family* and wife. Pope, Moral Essays, iii. 382.

4. In the most general sense, those who descend from a common progenitor; a tribe or race; kindred; lineage. Thus, the Israelites were a branch of the *family* of Abraham; the whole human race constitutes the human *family*.

Hence—5. Any group or aggregation of things classed together as kindred or related from possessing in common characteristics which distinguish them from other things of the same order. Thus, a body of languages regarded as representatives of a common ancestor, or as having come by gradual processes of alteration and divarication from the same original tongue, is called a *family*: as, the Indo-European *family*; the South African *family*.

There be two great *families* of things, sulphureous and mercurial. Bacon, Nat. Hist.

The states of Europe were, by the prevailing maxims of its policy, closely united in one *family*. Everett.

Specifically—6. In scientific classifications, a group of individuals more comprehensive than a genus and less so than an order, based on fewer or less definite points of physical resemblance than the former, and on more or more definite ones than the latter. In zoology the name of a family now almost invariably ends in *-idae*, which has the force of a patronymic. The prime divisions of a family are termed *subfamilies*, and end usually in *-inae*. The prime associations of families are in some refinements of classification called *superfamilies*; there is no obvious distinction, however, between these and suborders. The recognition and definition of the family, as of other zoological groups, is entirely a matter of expert opinion, having no natural necessity for being; hence the wide difference among zoologists in their evaluation of the term. A modern family is usually less comprehensive than a genus as used in the last century. The use of the regular termination *-idae* has done much to fix the valuation of the family more stably than that of either the genus or the order. Zoological families are considered as being approximately of the same grade in classification as the groups called orders in botany. Hence the word *family* is generally used by botanists as a synonym of *order*: as, *order Ranunculaceae*, the crowfoot *family*. In cryptogamic botany the family is the prime division of the order or suborder, and the prime division of the family is the *subfamily* or tribe; but in some classifications the family is made to rank next below the tribe. The absolute rank of the family also varies with different authors, the family of one being the order of another, etc. The usual termination is *-ae* (or *-i*), but *-aceae* (or *-acei*) is used as a family termination in some cases. See *classification*.

7. Course of descent; genealogy.

=*Syn. Noted, Celebrated, Famous, Renowned, Illustrious, Distinguished, Eminent, Notable, Notorious, famed, far-famed, conspicuous, remarkable, signal.* The first nine words express degrees and kinds of the presence or prominence of a person or thing in public knowledge or attention. *Noted, celebrated, famous*, are of an ascending scale of strength, and may be used in a good or a bad sense: as, a *celebrated* thief; a *famous* forger. The use of *celebrated* in a bad sense is rather new and less common. *Noted* is not much used by fastidious writers. *Celebrated, renowned, illustrious*, are also on an ascending scale of strength. *Celebrated* is, by derivation, commemorated in a solemn way, and occasionally shows somewhat of this meaning still. *Renowned* is, literally, named again and again. *Illustrious* suggests luster, splendor, in character or conduct: as, *illustrious* deeds; making one's country *illustrious*. *Distinguished* means marked by something that makes one stand apart from or above others in the public view. *Eminent* means standing high above the crowd. *Notable* is worthy of note, and so memorable, conspicuous, or notorious: as, a *notable* liar. *Notorious* is now used only in a bad sense, having a large and evil fame. A man may be *notable, noted, or famous* for his eccentricities or his industry, *celebrated* for his wit, *renowned* for his achievements, *illustrious* for his virtues, *distinguished* for his talents, *eminent* for his professional skill or success, *notorious* for his want of principle. farm¹ (färm), *n.* [*Early mod. E. also ferme, ferme*; *< ME. ferme*, rent, revenue, particularly as collected by a 'farmer,' factor, or steward, hence also stewardship; also a meal, a feast; *< AS. feorm* (fem), gen. acc. etc., *feorme*, provision, food, supplies; provisions, etc., supplied by a vassal or tenant to his lord, esp. to the king; hence an estate from which such supplies are due (*cyninges feorm*, late *AS. cynges feorme-hám*, 'king's farm'); hence also a meal, a feast, and, generally, entertainment (of a guest or, as a tenant's duty, of his lord), harboring (of a fugitive); also, rarely, use, advantage (> *feormian*, *ge-feormian*, supply with food, sustain, entertain, receive (a guest), harbor (a fugitive), etc., > *feormere*, a purveyor (of a guild), *feormung*, and *fyrnht*, a harboring (of fugitives), etc.); orig. perhaps 'a living, means of subsistence,' connected with *feorh*, life, = *OS. ferah*, *ferh* = *OHG. ferah*, *ferh*, *MHG. verch* = *Icel. fjör*, life, = *Goth. fairhous*, the world. But as *AS. feorm* is always rendered in *ML.* by *firma* or *ferma*, which is formally identical with the fem. of *L. firmus*, *ML.* often spelled *fermus* (> *OF. ferme*, *ME. ferme*, > *mod. E.*, with restored *L. vowel*, *firm*), most writers have assumed the actual identity of the two words (*L. firma*, fem. adj., and *ML. firma* or *ferma*, *n.*), "either because the farms were at first inclosed or fortified with walls, or because the leases were confirmed or made more certain by signature": see *firm*, *a.*, *firm*, *v.*, *firm*, *n.* But the *AS.* form appears to be the original. The *ML. firma*, *firma* has the *AS.* senses, and, later, the senses of rent, revenue, particularly as collected by a farmer or factor, also in general a tax, tribute, impost. Hence *OF. ferme*, *F. ferme* = *Pr. ferma*, in same senses, the *OF.* being partly the source of the *ME.* form. The mixture of forms and senses has confused the history of the word. The purely agricultural sense is comparatively modern.] 1. faro (fä'rō), *n.* [Also written *pharao*, *pharaon*, after *F. pharaon*; said to be named from a figure formerly on one of the cards, representing Pharaoh, King of Egypt.] A game played by betting on the order in which certain playing-cards (with reference simply to face-value) will appear when taken singly from the top of the pack. The players sit at one side of a table, and the dealer at the other. The dealer always represents the bank, having in charge the paying and claiming of bets. In the United States the table has on its center the "lay-out," or representation of thirteen cards, from the ace up to the king, in regular order. After bets have been placed on single cards or combinations, the dealer removes the top card from a complete pack placed face up in a box, which card does not count; he then withdraws and pays those made on the other; the appearance together of two cards of the same value is called a "split," and the better loses half of his stake. Any bet may be "copped" by placing a button on top of the money or checks, and this changes the bet to one that the card will show for the dealer. The showing of two cards constitutes a "farm," and after each turn new bets are made for another, down to the last three cards of the pack; the only betting allowed after this is on "calling the turn," or guessing which will show first. The European game is essentially the same, except that the layout is arranged in a small book.

2. Voluntary abstinence from food, as a religious penance or discipline, as a means of propitiation, or as an expression of grief under affliction present or prospective. Roman Catholic theologians distinguish between *natural* and *ecclesiastical fasts*. In the former, which are required of those who are about to communicate, there is a total abstinence from all food and drink; the latter imposes certain limits and restrictions as regards both the kind and the quantity of the food.

3. A time of fasting; the prescribed period or duration of abstinence. The only fast ordained by the Mosaic law was that of the day of atonement; but other fasts were subsequently instituted on account of great national calamities, and special fasts also were appointed on account of special impending peril. In the Roman Catholic Church all baptized persons over twenty-one years of age are required to observe appointed days of fasting, on which, subject to certain exceptions and exemptions, as the requirements of health, they are required not to eat more than one full meal. These days include the forty days of Lent, the ember-days, the Fridays of the four weeks of Advent, and the vigils of Pentecost or Whit-Sunday, of the feasts of St. Peter and St. Paul, of the Assumption of the Virgin Mary, of All Saints, and of Christmas day. All Fridays not fast-days are days of abstinence. (See *fast-day*, 1.) In the Greek Church, in addition to the forty days of Lent, there are three principal fasts, each lasting a week: (1) that of the Holy Spirit, immediately after Pentecost; (2) that of the Virgin, in August; and (3) that of the Nativity. In the Episcopal Church, Ash Wednesday and Good Friday are fasts; Lent, the ember-days, the three rogation-days, and all Fridays are only days of abstinence.

A day on which fasting is observed; specifically, a day appointed for fasting as a religious observance by some recognized authority, ecclesiastical or civil; in the most restricted ecclesiastical sense, a day on which, or on part of which, total abstinence from food is prescribed, in contradistinction to a day on which a limitation is imposed on the kind or quantity of food to be taken, called a *day of abstinence*. See *fast³*, n. In some of the United States, especially in New England, special days of fasting and prayer are appointed by the governor of the State, a custom derived from the original Puritan settlers.

The Pilgrims found it written, "They that sow in tears shall reap in joy. He that goeth forth and weepeth, bearing precious seed, shall doubtless come again with rejoicing, bringing his sheaves with him." This beautiful poetry was translated into the policy of the Pilgrims by establishing a *Fast-day* in March or April, and a Day of Thanksgiving in November. Thus the two people were to pass through the two gates of the year, Tears and Smiles, and observe them as Holy Days, all other profane and misleading festivities—Christmas, New Year's, and Saint's days without number—being laid aside.

H. W. Beecher, Norwood, xlix.

2. In Scotland, a day set apart for humiliation and prayer; specifically, a day thus observed during the week immediately preceding certain celebrations of the Lord's supper. Business is generally suspended during these fast-days. Formerly their observance on fixed half-yearly or yearly dates, differing for different localities, was universal; but the growing tendency to make them mere holidays has led to their abolition in Edinburgh, Glasgow, and elsewhere.

II. n. [= D. *vet*, G. *fett*, Sw. *fett* = Dan. *fedt*, *fat*, n.; from the adj.] **1.** A white or yellowish oily solid substance forming the chief part of the adipose tissue of animals, and also found in plants. In chemistry the fats are odorless, tasteless, colorless or white bodies, which may be either solid or liquid. They are insoluble in water and cold alcohol, but dissolve freely in ether, chloroform, and benzene. The solid neutral fats, like spermaceti, suet, and lard, and the liquid non-volatile oils, like sperm- and olive-oil, are classed together as fats. They are compound ethers formed by the union of fatty acids with the triatomic alcohol glycerin. They are composed of carbon, hydrogen, and oxygen, but contain no nitrogen. The most common and abundant are stearin, palmitin, and olein. Of these stearin and palmitin are solids at ordinary temperatures, and olein is a liquid. Most animal and vegetable fats are mixtures of two or more of the simple fats, and their hardness depends largely on the relative quantity of olein or other liquid fat in them. When a fat is treated with an alkali, the fatty acid unites with the alkaline base, making a soap, and glycerin is set free. When a soap is treated with an acid, the base is taken from the fatty acid which is thus set free.

fatalism (fā'tal-izm), n. [= D. G. *fatalismus* = Dan. *fatalisme* = Sw. *fatalism*, < F. *fatalisme* = Sp. Pg. It. *fatalismo*; as *fatal* + -ism.] **1.** The doctrine that all things are subject to fate, or come or go by inevitable predetermination. *Fatalism* is a doctrine which does not recognize the determination of all events by causes, in the ordinary sense; holding, on the contrary, that a certain foreordained result will come about, no matter what may be done to prevent it. *Fatalism* is thus directly opposed to *necessitarianism*, according to which every event is determined by the events which immediately precede it, in a mechanical way. *Necessitarianism* seems hardly to leave room for final causes, while *fatalism* is the doctrine that certain results are sure to come in spite of all that efficient causes may do to prevent them. See *necessity*.

To confute these three *fatalisms*, or false hypotheses of the system of the universe, Cudworth designed to dedicate three great works—one against atheism, another against immoral theism, and the third against the theism whose doctrine was the inevitable "necessity" which determined all actions and events, and deprived man of his free agency.

If one of the players threw some particular throw of the dice, he was disabled from bearing off any of his men, and therefore *failed* in winning the game, and hence the appellation of it.

A festival in commemoration of some event, or in honor of some distinguished person; a set time of festivity and rejoicing: opposed to *fast*. In this sense the word is almost entirely confined to ecclesiastical feasts. In the Jewish church the most important feasts, apart from the sabbath, were those of the Atonement, the Passover, Tabernacles, and Pentecost. To these were subsequently added the feasts of Purim and the Dedication. In the Christian church Christmas and Easter are feasts of almost universal recognition and observance. To these many others have been added, celebrating events in the life of Christ or in the lives of the apostles, saints, and martyrs. Feasts are divided into *movable* and *immovable*, according as they occur on a specific day of the week succeeding a certain day of the month or phase of the moon, or at a fixed date. Easter is a movable feast, upon which all other movable feasts depend; Christmas is an immovable feast. In the Roman Catholic Church feasts are further divided into *obligatory* and *non-obligatory*, and again into *doubles*, *semi-doubles*, *simples*, etc., according to the religious offices required to be recited in the church service.

See *dolor*. — *Feast of Eggs*. See *Egg Saturday*, under *eggl*. — *Feast of fools* and *feast of asses*, festivals, simulating the Saturnalia, and perhaps a survival of them, celebrated in many countries of Europe, especially in France, during the middle ages, from Christmas to Epiphany, but chiefly on the 1st of January in each year. In the feast of fools a bishop, archbishop, or pope of fools was chosen and placed on a throne in the principal church, and a burlesque high mass was said by his orders. The feast of asses, following the former or celebrated on a later day, was a pageant that owed its name to the important part which the ass played in it. In some places the allusion was to the ass of Balaam, in others to the ass which is said to have stood beside the manger in which the infant Saviour was laid, or to the ass on which Mary and the child fled into Egypt, or in others still, to the ass on which Jesus made his triumphal entry into Jerusalem. Some of the features of these festivals still survive in the carnival. — *Feast of lanterns*, a Chinese festival held annually at the first full moon of the year (the 15th day of the first month), when colored lanterns are hung at every door, and the graves are illuminated. — *Feast of Maccabees*, in the ancient Christian church, a festival celebrated annually in honor of the seven Maccabees, who died in defense of Jewish law. It is uncertain on what day the festival was held, but the Roman Catholic martyrology places it on the 1st of August. — *Feast of orthodoxy*, of the federation of the Sacred Heart, of the Presentation, etc. See *orthodoxy*, *federation*, *heart*, etc. — *To make feasts*,

to show gladness; pay flattering attention; give friendly entertainment

Chaucer, Death of Blanche, l. 638.

-Syn. 2. *Fest, banquet, festival.* The idea of a social meal of unusual richness or abundance, for the purpose of pleasure, may be common to these words. *Fest* is generic; specifically, it differs from *banquet* in the fact that at a *fest* the food is abundant and choice, while at a *banquet* there is richness or expensiveness, and especially pomp or ceremony. The essential characteristic of a *feast* is a concurrence in the manifestation of joy, the joyous celebration of some event, feasting being a frequent but not necessary part; as, to hold high *feast*. See *carousal*.

When I make a *feast*,
I would my guests should praise it, not the cooks.
Sir J. Harrington, Writers that carp, etc.
Go to your banquet then, but use delight
So as to rise still with an appetite.

-Syn. *Deed, feat, exploit, achievement.* These words are arranged in the order of strength; *deed*, however, may have a much more elevated character than *feat*, and even surpass *exploit*. A *deed* may, on the other hand, be base or ignoble. It is, therefore, often accompanied by an adjective of quality. A *feat* is generally an act of remarkable skill or strength; as, the *feats* of a juggler, a ventriloquist, an athlete. An *exploit* is especially an act of boldness or bravery, with various degrees of mental power in working it out. An *achievement* is the result of large ability in planning, and diligence and boldness in executing. *Feat, exploit, and achievement* differ from *act, action, and deed* in that the first three always, and the last three only sometimes, represent something great.

Bulg. Slov. Serv. pero = Bohem. péro = Pol. pióra, feather (OBulg. pirati, prati, fly), = Skt. patra, a feather, wing, leaf, patatra, a wing, cf. patara, n., flying, < √ pat, fly, descend, fall, = Gr. πτε-αβα, fly, redupl. πτερο, fall, = L. petere, fall upon, make for, seek (whence E. petition, appetite, compete, etc.)] 1. One of the epidermal appendages which together constitute the plumage, the peculiar covering of birds; also, collectively, the plumage. Feathers are extremely modified scales. The nearest approach to them in animals other than birds is probably the quills of the porcupine. Feathers are epidermal, non-vascular, and non-nervous appendages, consisting of a horny and pithy substance, and subject to periodical molt. They grow some-

what like hairs, in a little pit or pouch formed by an invagination of the dermal layer of the integument, in a closed follicle, upon a peculiarly molded papilla, which causes the feather to assume its special shape. They are seldom implanted uniformly over the surface, but grow in special tracts or areas separated by naked spaces. (See *pteryla, apterylia*.) All of a bird's feathers collectively considered constitute the *plumage* or *plissia*. (See *cut under bird*.) A perfect feather consists of a main stem, *shaft*, or *scape*; a supplementary stem, *aftershaft*, or *hyporachis*; and *vanes*, *webs*, or *vezzilla*; these together making the *standard*. The *scape* is divided into two parts: one, nearest the body of the bird, is the *barrel*, *quill*, or *calamus*, a hard, horny, hollow, semi-transparent tube with one end inserted in the skin; it bears no webs, and passes insensitively at a point marked by a little pit (*umbilicus*) into the shaft proper or *rachis*. This is squarish in section, tapers to a fine point, is highly elastic, opaque, and solidly filled with dry pith; it bears the *vezzilla*. The *aftershaft* is usually like a miniature of the main feather, springing from the stem of the latter at the junction of the calamus and *rachis*. (See *aftershaft*.) With its *vanes* it is called the *hypoplume*. Sometimes it is as large as the main feather. There are two *vanes*, on opposite sides of the *vezzilla*. Each *vane* consists of a series of mutually appressed, thin, flat, linear or lanceolate plates, the *barbs*, set off obliquely from the *rachis* by their basal ends at a varying open angle. (See *cut under barb*.) To cause these plates to cohere with one another, and make a webbing of the *vane*, each barb bears secondary *vanes*; these are *barbules*, and bear to the barbs the same relation that the barbs bear to the *rachis*. Barbules are also fringed, as if frayed out, along their lower edges; each such fringe makes a tertiary *vane*. When these *vanes* are simple, they are termed *barbules*; when hooked, *hooklets* or *hamuli*. (See *cut under barbule*.) From such perfect structure feathers may be reduced in various ways, even to lacking everything but the shaft; when this is very thick, feathers become much like scales, as in the penguin; when it is fine, they resemble hairs or bristles. In general, three types of feather-structure are recognized: (1) The perfectly feathery, *plumaceous* or *pennaceous*, structure. The goose-quill used as a pen is a good example (though it lacks an *aftershaft*). Most contour-feathers are *pennaceous*. (2) The downy or *plumaceous*, such as makes up the under-plumage or down. (3) The *filoplumaceous*, which approaches a bristle or hair. (See *cut under filoplume*.) But there is no strict line of demarcation, and in fact most feathers are *pennaceous* with *plumaceous* bases of the *webs*. Feathers are also classified as (1) *pennae*, *plumae*, or contour-feathers; (2) *plumulae*, or down-feathers; (3) *semiplumae*, or half-feathers; (4) *filoplumae*, or thread-feathers; and (5) *pterylae*, dust-feathers, or powder-down. (See *phases below*.) The acquisition of feathers is called *outgrowing*; their loss, *eclipse*. Birds which acquire feathers in the egg are *Proceras* or *Ptilopodes*; those which are hatched naked are *Altrices*, *Psittopodes*, or *Gymnopedes*. Feathers are of extremely rapid growth. They are of many shapes, often remarkable, and of every possible color. The color is usually due to actual pigmentation, but in many cases to iridescence. The optical effect of iridescence is due to the texture of the *webs*. Among all epidermal structures, feathers probably combine in the highest degree the qualities of lightness, strength, and elasticity. They are also very warm, and in many cases water-proof.

—3. Pertaining to a union of states in some essential degree constituted by and deriving its power from the people of all, considered as an entirety, and not solely by and from each of the states separately: as, a *federal* government, such as the governments of the United States, Switzerland, and some of the Spanish-American republics. A *federal* government is properly one in which the federal authority is independent of any of its component parts within the sphere of the federal action: distinguished from a *confederate* government, in which the states alone are sovereign, and which possesses no inherent power.

The wants of the union are to be supplied in one way or another: if by the authority of the *federal* government, then it will not remain to be done by that of the state governments.

A. Hamilton, *Federalist*, No. xxxvi.

The definition of treason against the United States . . . took notice of the *federal* character of the American government by defining it as levying war against the United States, or any one of them.

Barcroft, *Hist. Const.*, II. 149.

Both these leagues [the Achaian federation and the Aetolian League] were instances of true *federal* government, and were not mere confederations: that is, the central government acted directly upon all the citizens, and not merely upon the local governments.

J. Fiske, *Amer. Pol. Ideas*, p. 76.

But Jefferson pointed out that party divisions must always exist in every free and deliberate society, and that if on a temporary superiority of the one party the other should resort to disunion, no *Federal* government could ever exist.

See *Constitution of the United States*, under *constitution*.—**Federal headship**, in the system of federal theology, the headship of Adam, who is regarded as the federal head of the race, because he was the one with whom, as a representative of the race, the covenant of works was made by God, prior to the fall.—**Federal party**, in *U. S. hist.*, a name applied first to those who favored the adoption by the States of the Constitution framed by the Constitutional Convention at Philadelphia in 1787, and later to the party which in the first years of the federal government became fully formed under the leadership of Alexander Hamilton. It controlled the general government till 1801, then declined, and about 1824 became extinct. Its chief aims were the creation and maintenance of a strong central government, the strengthening of the spirit of nationalism, the control of politics by the more intelligent and substantial classes, the fostering of commercial interests, and the preservation of friendly relations with Great Britain.

federalism (fed'e-ral-izm), *n.* [= *F. fédéralisme = Sp. Pg. It. federalismo*; as *federal + -ism*.] The doctrine or system of federation or federal union in government; the principle of assigning to the care of a central government such matters of common concernment as may be agreed upon, and all others to that of the governments of the federated states, provinces, or tribes; more specifically, the aggregate principles or doctrines of a federal party, as the Federalists of the United States. Federalism has been practised by many uncivilized races, as the ancient German tribes and some of the American Indians, chiefly for warlike purposes. It existed for certain civil purposes also among the Greeks and other ancient and medieval peoples, as in the English heptarchy, was more largely developed in the old German empire, and has since been adopted in many countries, especially republics. (See *federal*, *a.*, 2.) Its introduction into France was advocated by the Girondists after the fall of the monarchy.

We see every man that the Jacobins chose to apprehend taken up, . . . whether he be suspected of royalism or federalism, modernism, democracy royal, or any other of the names of the faction which they start by the hour.

Burke, *Policy of the Allies*.

Intense Federalist as he was, his *Federalism* agreed with a stout anti-aristocratic spirit.

H. E. Scudder, Noah Webster, p. 46.

Stated broadly, so as to acquire somewhat the force of a universal proposition, the principle of *federalism* is just this:—that the people of a state shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distinct governing body could possibly exercise; but that, as regards matters of common concern between a group of states, a decision shall in every case be reached, not by brutal warfare or by weary diplomacy, but by the systematic legislation of a central government which represents both states and people, and whose decisions can always be enforced, if necessary, by the combined physical power of all the states.

J. Fiske, *Amer. Pol. Ideas*, p. 133.

The method by which *federalism* attempts to reconcile the apparently inconsistent claims of national sovereignty and of state sovereignty consists of the formation of a constitution under which the ordinary powers of sovereignty are elaborately divided between the common or national government and the separate States.

A. V. Dicey, *Law of Const.*, p. 131.

federalist (fed'e-ral-ist), *n.* [= *F. fédéraliste = Sp. Pg. It. federalista*; as *federal + -ist*.] 1. S. hist.* [*cap.*], a member of the Federal party. See *federal*, *a.*

And according to the degree of pleasure and pride we feel in being republicans ought to be our zeal in cherishing the spirit and supporting the character of *federalists*.

Madison, *Federalist*, No. x.

The *Federalists* were the only proper Tories our politics have ever produced, whose conservatism truly represented an idea, and not a mere selfish interest—men who honestly trusted democracy, and stood up for experience, or the tradition which they believed for such, against empiricism.

Lowell, *Study Windows*, p. 105.

The party name of *Federalist* has since become historical; and yet, to speak logically, it was the Anti-Federal party that sustained a federal plan, while the *Federalist* contended for one more nearly national.

fee² (fē), *n.* [*ME. fee, pl. fees, feez*, an estate held in trust or under conditions, a feud, assimilated in form to *fe, fee*, property, etc.

(with which it is ult. identical), < OF. *fied, fie, feu*, var. of *fieu*, later *fief*, > E. *fief* (which does not seem to occur in ME.: see *feoff*), < ML. *feudum*, property held in fee: see *fief, feoff, feud²*.] **1.** An estate in land, of indefinite duration, granted by and held of a superior lord, in whom the ultimate title resides, on condition of performing some service in return. See *feud²*. In this, which is its original sense, it implies the idea of reward for service or allegiance, and was used in contradistinction to estates in *allodium*, or entire property, which were generally small allotments held free of any obligation.

The tenure of lands is altogether grounded on military laws, and held as a fee under princes.

Hooker, *Eccles. Polity*, v, 80.

2. An estate of inheritance; an estate in land belonging to the owner and his heirs and assigns forever. In the latter case it is more specifically termed a *fee simple*. (See *conditional fee* (b), below.) The fee is the highest and most extensive interest that a person can have in lands. In this sense the king might have a fee, but not in the sense of def. 1. After the abolition of the feudal system the word continued to be used of real property, and although in the United States generally land is held in *allodium*, the private ownership, if subject to no paramount right except that of eminent domain vested in the State, is termed the *fee*. The word when unqualified may or may not mean an absolute or unqualified fee, or fee simple.

3. Estate in general; property; possession; ownership.

Those Ladies, which thou sawest late,
Are Venus Damazels, all within her fee,
But differing in honour and degree.

My lute and I are lords of more

Than thrice this kingdom's fee.

Lowell, *Singing Leaves*.

Base fee, a qualified fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, in the English law of settlements, the estate created by absolute alienation by a tenant in tail alone (see *entail*), which, being made without the consent of the protector, does not bar remainders or reversions, but only the grantor's own issue, and hence is liable to be defeated by the failure of such issue.

The curious kind of estate created by the conveyance in fee simple of a tenant in tail not in possession, without the concurrence of the owners of estates preceding his own, is called a *base fee*. *F. Pollock*, *Land Laws*, p. 108.

Conditional fee, (a) Any fee granted upon condition. (b) A fee limited to particular heirs or a particular class of heirs, under the common-law rule that, on the donee's once having such heirs, the estate became absolute for all purposes of alienation, on the ground that a condition once performed was at an end. (See *entail*.) To designate this kind of conditional fee at the common law, the more appropriate phrase is *fee simple conditional*. This evasion of the intent of donors to reserve a reversion on a failure of heirs was put an end to by a statute known as *De Donis*, which enacted that the will of the donor should be observed, and that on the failure of heirs the property should revert to the donor. The estate of the donee under this statute was termed a *fee tail*. See *tail²*. (c) Later, the term *conditional fee* was applied to the estate of a mortgagee of land, under a mortgage in the usual form, which was regarded as vesting the fee in the mortgagee subject to its being divested by performance of the condition, namely payment.

Determinable fee, a fee determinable by a condition or a conditional limitation; more specifically, a fee created by a limitation to the grantee and his heirs till the happening of a future event which may or may not happen, as a gift to A and his heirs, and if A dies without issue, then to another.—**Fee simple, fee simple absolute**, a fee that is not qualified. See *def. 2*.—**Fee tail**. See *conditional fee* (b). **Great fee**, the holding of a tenant of the crown.

By the feudal law, a *great fee* or great lordship, which are convertible terms, was the highest order of possession, and was held directly from the crown.

Baines, *Hist. Lancashire*, II, 14.

In his **demean as of fee**. See *demean*.—**Limited fee**, a determinable fee; more specifically, a fee determinable by a conditional limitation.—**Plowman's fee**, peasant tenure; the custom by which lands descended to all the sons of the tenant in equal shares, with, however, some privilege or birthright in favor of the elder or younger son: a rule of descent which under the feudal system gave way to primogeniture.

The strict English primogeniture as applied to the rustic holdings, sometimes called *fiefs* de roturier or *'ploughman's fee*.

Encyc. Brit., XIX, 735.

Qualified fee, a base fee; a freehold estate of inheritance to which a qualification is annexed, so that it must terminate whenever the qualification is at an end; more specifically, the estate created by a limitation to the grantee and the heirs of an ancestor of his in the paternal line whose heir he also is, as a gift to B and the heirs of A, his father.

Specifically—2. Any special organ of touch of an animal; a tactile part. (a) A common name applied to the antennae of insects and crustaceans, and to the palpi of insects and spiders. feeling (fē'ling), *n.* [Verbal n. of *feel¹, v.*] 1. The act of sensing or perceiving by sensation. Specifically—(a) The act of perceiving by touch, or the sense of touch. (b) More comprehensively, all that part of the sensory function (as the sensing of cold, hunger, etc.) which is not included in the special senses of sight, hearing, smell, and taste. See *touch*, *n.*

Why was the sight

To such a tender ball as the eye confined, . . .

And not, as *feeling*, through all parts diffused?

Milton, S. A., I. 96.

2. A sensation. Specifically—(a) A sensation conveyed by the sense of touch. (b) More comprehensively, sensation of any kind not assignable to one of the special senses of sight, hearing, taste, and smell; as, a *feeling* of warmth; a *feeling* of pain; a *feeling* of drowsiness.

Some of the organs in their sound condition have no organic *feelings*. *G. T. Ladd, Physiol. Psychology*, p. 513.

3. The immediate quality of what is present to consciousness in sensation, desire, or emotion, considered apart from all activity of thought; the pure sense-element in consciousness; in a loose use, any element of consciousness not recognizable as thought or will. The word (that is, its equivalent) was introduced into philosophy as an exact term in this sense by Tetens, a German Wolffian philosopher of the eighteenth century. Kant modified the meaning, for the convenience of his system, so as to restrict it as in def. 4, below.

The point which at present concerns us is simply that, when *feeling* is said to be the primordial element in consciousness, more is usually included under *feeling* than pure pleasure and pain, viz., some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. *J. Ward, Encyc. Brit.*, XX. 40.

I have in this volume used *Feeling* as the name for the genus of which Sensation (with Muscular Feeling) and Emotion are the two species.

A. Bain, Emotions and Will, p. 615, App.

It cannot be too strongly urged in the face of mystical attempts, however learned, that there is not a landmark, not a length, not a point of the compass in real space which is not some one of our *feelings*, either experienced directly as a presentation or ideally suggested by another *feeling* which has come to serve as its sign.

W. James, Mind, XII. 208.

Feelings which correspond directly with an interaction between the organism and its environment are termed

sensations; those which correspond indirectly are termed emotions; and when the remoteness from direct correspondence is great, the *feeling* is in some cases termed a sentiment.

C. Morret, Mind, IX. 385.

It may be useful to guard against a further misconception, and to state explicitly that the term *feeling*, the most general term in psychology, includes emotion, not less than sensation and perception.

G. H. Lewes, Probs. of Life and Mind, II. iv. § 17.

4. In a restricted sense, pleasure or pain; any state or element of consciousness having a pleasurable or a painful aspect.

As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (a) a touch, as *feeling* of roughness; (b) an organic sensation, as *feeling* of hunger; (c) an emotion, as *feeling* of anger; (d) *feeling* proper, as pleasure or pain. But, even taking *feeling* in the last, its strict sense, it has been maintained that all the more complex forms of consciousness are resolvable into, or at least have been developed from, *feelings* of pleasure and pain. *J. Ward, Encyc. Brit.*, XX. 40.

The *feeling*, the pleasurable or painful tone of the sensation, is always recognized as purely and simply a way in which the mind is affected.

G. T. Ladd, Physiol. Psychology, p. 504.

Hence—**5.** An emotion in so far as it is immediately present to consciousness, not having regard to the physiological disturbance which is one of its elements; the capacity for emotion; mental state, disposition, or faculty as regards emotion; as, a *feeling* of sympathy; a *feeling* of pride in the history of one's country. See *emotion*, 2.

Great persons had need to borrow other men's opinions to think themselves happy, for if they judge by their own *feeling*, they cannot find it. *Bacon, Great Place* (ed. 1887).

Nor, again, can we admit without verification the proposition which some philosophers, including Aristotle (and Plato in some passages), seem to assume a priori: that the kind of *feeling* which is most pleasant, or preferable, as *feeling* will always accompany the kind of activity which we approve. *H. Sidgwick, Methods of Ethics*, p. 162.

The motive of all action is *feeling*. All great movements in history are preceded and accompanied by strong *feelings*.

L. F. Ward, Dynam. Sociol., I. 11.

This good-hearted old fellow . . . betrayed some *feeling* at the explosion of grief, and betook himself to soothing the young girl. *J. E. Cooke, Virginia Comedians*, I. xii.

Specifically—6. Fine or refined sensibility; fine emotional endowment; especially, tenderness or affectionateness of heart; susceptibility; in an adverse sense, sentimentality: as, a man of *feeling*: sometimes in the plural: as, to hurt or injure one's *feelings*.

It must be Willoughby, therefore, whom you suspect. But why? Is he not a man of honour and *feeling*? . . . Can he be deceitful? *Jane Austen, Sense and Sensibility*, xv.

7. Obscure or vague perception; belief the reasons for which are not clearly understood: as, every one had a *feeling* of the truth of this statement.

It thus appears that when pushed to our last resort, we must retire either upon *feeling* or belief, or both indifferently. *Sir W. Hamilton*.

8. Opinion or determination as founded on or resulting from emotion.

The *feeling* of the house could not be mistaken.

The *feeling* of the Middle Ages evidently was that bare stone inside a building had an unfinished and uncomfortable look, and was quite as unsuitable in a richly decorated and furnished cathedral as it would now be considered in a lady's drawing-room.

Encyc. Brit., XXIII. 153.

9. In the *fine arts*, the impression or emotion conveyed by the general expression of a work of art, or of some part or detail of it, especially as embodying a particular emotion or conception of the artist.

There can be little doubt that the Norman architects, with true Gothic *feeling*, always intended that their churches should eventually be vaulted, and prepared them accordingly, though in many instances they were constructed with wooden roofs, or compromises of some sort. *J. Ferguson, Hist. Arch.*, I. 516.

Feigned exchange. See *exchange*.—**Feigned issue**, in law, an issue made up for trial by agreement of the parties or by an order of court, instead of by the ordinary legal procedure. Thus it was usual in chancery, when a disputed question of fact, unsuitable to be determined by a jury than by the chancellor, arose in a suit, to order it submitted to a jury by means of pleadings framed as if an action at law had been brought on a wager involving the question, so as to present the question to the jury as the exact issue to be decided. This practice has been generally altered or supplanted by recent legislation providing for the framing of issues without the fiction of a separate action.—**Syn.** To affect, simulate, profess.

felapton (fe-lap'ton), n. In logic, the mnemonic name of that mood of the third figure of syllogism which has both the premises universal and one of them negative. The following is an example: The loss of energy of a radiating mass of gas which gravitates to its own center is an emission of heat; but no loss of energy in such a mass of gas can tend to make the body cooler; hence, some emission of heat does not tend to make the radiating body cooler. According to some logicians, this reasoning is fallacious, because neither premise asserts that such a case actually occurs. The word *felapton* is one of the mnemonic names invented in the thirteenth century, and found in the "Summulae" of Petrus Hispanus. The three vowels, *e*, *a*, *o*, indicate the quantity and quality of the three propositions, which are universal negative, universal affirmative, and particular negative, respectively. The letter *f* signifies that the mood is to be reduced to *ferio*, and the *p* that in the reduction the minor premise is to be converted per accidens.

feldspar (feld'spär), *n.* [*A var. of feldspath, accom. to E. spar².*] In mineral, one of a very common group of closely related minerals, all silicates of aluminium, together with either calcium, sodium, potassium, or in one case barium. They crystallize in the monoclinic or triclinic system with closely similar angles. The prismatic angle is not far from 120°, and they have two easy cleavages which make an angle of 90°, or nearly 90°, with each other. Their specific gravity lies between 2.6 and 2.8, and their hardness between 6 and 7. In color they vary from clear and glassy to white, grayish, and light shades of yellow, red, or green, rarely darker green to black. They occur in distinct crystals, also in massive forms varying in structure from coarsely cleavable to granular-crystalline, compact, and hornstone-like. They form an essential constituent of many of the common crystalline rocks, as granite, gneiss, syenite, diorite, most kinds of basalt, andesite, trachyte, etc. The monoclinic feldspars are orthoclase and hyalophane. The former is a potash feldspar (see orthoclase), and is the commonest of the group; the latter is a baryta feldspar, and is a rare species. Closely related to orthoclase is the triclinic microcline (which see), having the same composition, but varying slightly in form. Besides these there are the triclinic (lime-soda) feldspars, called in general *plagioclase*, because of the oblique angle between their two cleavages, and forming a series varying progressively in composition, form, optical characters, and specific gravity from the lime feldspar anorthite to the sodium feldspar albite; the intermediate species are considered as isomorphous compounds of these two extremes in varying proportions. Those ordinarily recognized are named in order, labradorite, andesine, and oligoclase; the last approaching most closely to albite. The increase in soda in the members of the series is accompanied by an increase of silica, the species being increasingly acidic in the order named: thus, anorthite contains 43 per cent. of silica, and albite 69 per cent. The specific gravity diminishes in the series from anorthite (2.76) to albite (2.61). Certain triclinic feldspars containing considerable potash and with an angle of cleavage varying but little from 90° are sometimes grouped under the name *orthoclase*. Common feldspar, or orthoclase (and much used in the manufacture of porcelain; some kinds are employed for ornaments, as aventurin feldspar or sunstone, also moonstone (an opalescent variety of orthoclase), albite or oligoclase, and most of all, the species labradorite, beautiful for its play of colors. 5. (a) A station of privilege and emolument in
English colleges which entitles the holder (called a
fellow) to a share in their revenues. In Oxford and
Cambridge the fellowships were either constituted by
the original founders of the colleges to which they
belong, or they have been since endowed. In almost
all cases their holders must have taken at least the
first degree of bachelor of arts, or of students in the
civil law. Fellowships vary in value from about £30
to £250 a year and upward, and they all confer upon
their holders the right to apartments in the college, and
certain privileges as to commons or meals. Though many
fellowships are tenable for life, in general they are
feited upon attainment by the holder of a certain position
in the church or at the bar, or upon his marriage. In
this last case, however, a fellow may retain his fellowship
by a special vote of the college. Except in the single case
of Downing College, Oxford, where graduates of Oxford
and Cambridge are eligible, fellowships are confined to
graduates of the university to which they belong. (b) In
colleges and universities of the United States, a
scholarship or sum of money granted for one or more

similar custom among the Persians and Parthians (Jew.
Antiq., 18, 9, § 3), who practised it in treaties, as constituting
an inviolable pledge of fidelity.

1. An unwoven fabric of short hair or wool, or of wool and fur, agglutinated or matted together, with the aid usually of moisture and heat, by rolling, beating, and pressure. The property of felting results chiefly from the serrated or jagged structure of wool and most hairs, as well as from the crimped or wavy form natural to some animal fibers. The making of felt is thought to have originated at a very early date in the western part of Asia, and the best and most durable felt is still made in Persia and the neighboring countries. Felt floor-mats an inch or more thick and of admirable texture and printed in rich designs in color are used upon marble and tiled floors in Persia. (See *munud*.) In Europe, throughout the middle ages and later, felt was a usual material for hats, and was also used for stuffing or bombasting garments for both defense and fashion. Felt is now in general use not only for hats, but for clothing and upholstery, carpets, table-covers, and mats, jackets for steam-boilers, etc., and lining for roofs and walls. Broadcloth and other fulled woolen fabrics are partially felted by the process of fulling; and the familiar shrinkage of woolen garments in washing results from an unsought felting, which draws the fibers of the fabric closer together.

Howbeit, they are of discretion to make feltes of Camels hair, wherewith they clothe themselves, and which they holde against the winde. *Hakluyt's Voyages*, I, 57.

It were a delicate stratagem to shoe

A coarse heavy paper, often saturated with tar, is much used for the same purpose. See *lining-paper*, and *tarted paper*, under *paper*. (b) A fabric made of hair, or asbestos and hair, sometimes saturated with a lime cement, used on steam-pipes and boilers as a non-conducting covering. (c) A compound of liquid cement and animal or vegetable fiber, applied with a brush for the same purpose.—**Paper-makers' felt,** a coarse, twilled, loosely woven material, neither teased nor shorn, used in paper-manufacture to place between wet sheets.—**Roofing-felt,** a material similar to lining-felt, used as a covering for roofs. This material is usually not a true felt, but an agglutination of hair or other animal fibers, compounded with a preparation of tar, and rolled into sheets. It is nailed down upon the roof in overlapping strips, and is usually coated subsequently with tar, or some special heavy pigment having tar or asphalt as a basis and commonly called *cement*.

aspera, along its posterior surface, bearing upon its upper extremity, by an oblique neck, a hemispherical head, and two trochanters, the greater and the lesser, and expanding below into two large condyles, the inner and the outer, both of which articulate with the tibia, but neither with the fibula. The slenderness of the bone is beyond an average for mammals, though in some it is still slender. Many femora, as of the horse, develop a third trochanter, and also may articulate with both bones of the leg. The reception of the head of the femur in the acetabulum is such that it articulates above with all three of the pelvic bones, the ilium, the ischium, and the pubis. 2. An inclosure round a yard, field, or other tract of ground, or round or along the sides of any open space, as part of a large room, a bridge, etc. Specifically, a fence for land is understood, especially in the United States, to be a line of posts and rails or wire, or of boards or pickets; but the term is ap-

plicable to a wall, hedge, ditch or trench, bank, or anything that serves to guard against unrestricted ingress and egress, to obstruct the view, or merely as a tangible dividing line. By American statutes, boundary-fences between adjoining owners are usually required to be 4 feet high (in some States 4½), and in good repair, and to consist of a suitable structure, or to be a watercourse or other barrier which the fence-viewers having jurisdiction shall deem sufficient.

Fermation (fēr-mā'shian), *a.* Pertaining to the French mathematician Pierre de Fermat (1601-65).—**Fermatian reasoning**, reasoning in the following form: "A certain character, *P*, if possessed by any one of a linear series of subjects, is necessarily possessed by the next following subject: now, the character *P* is possessed by the first subject of the series; ergo, it is possessed by all the subjects. The discovery of this form of reasoning by Fermat opened the theory of numbers to the researches of mathematicians. It holds good even if the series is infinite, so long as it contains no member which cannot be reached by proceeding by successive steps from the first member, as is the case, for example, with the entire class of finite positive integer numbers. In this particular Fermatian reasoning is contrasted, for example, with the syllogism of transposed quantity, which holds only for finite classes. On the other hand, the Fermatian inference falls in such a case as the following: If Achilles, pursuing a tortoise, is behind it at any instant, then he will still be behind it when he reaches the point where the tortoise now is; but he is behind it at first; therefore, he will always be behind it. The following is equally absurd: If any whole number is finite, the next greater whole number is finite; but 1 is finite; hence, all whole numbers are finite.

ferment (fēr'ment), *n.* [= *F. ferment* = *Sp. Pg. It.* *fermento*, *< L.* *fermentum*, leaven, yeast, a drink made of fermented barley, fig, anger, passion, contr. of "*fermentum*, *< fervere*, boil, be agitated: see *fervent*, *fervid*.] 1. A gentle boiling, or the internal motion of the constituent parts of a fluid. [Rare.]—2. That which is capable of causing fermentation. Ferments are of two kinds, organized and unorganized. Organized ferments belong to the lowest order of microscopic fungi. (See *fermentation*.) Unorganized or chemical ferments are substances capable of causing chemical changes in certain other substances without themselves being permanently changed in the process: as diastase, maltin, and ptyalin,

which convert starch into a soluble modification or into sugar; pepsin, which dissolves proteids, forming peptones; emulsin, which resolves amygdalin into oil of bitter almonds, prussic acid, and dextrose.

Palladius, *Husbandrie* (E. E. T. S.), p. 205.

3. Figuratively, commotion; heat; tumult; agitation: as, to put the passions in a *ferment*.

fermentation (fêr-men-tā'sh'on), *n.* [= *F. fermentatio* = *Sp. fermentación* = *Pg. fermentação* = *It. fermentazione*, < *L.* as if **fermentatio* (*n.*), < *fermentare*, ferment: see *ferment*.] 1. A gentle boiling or ebullition.—2. A decomposition produced in an organic substance by the physiological action of a living organism or by certain unorganized agents. See *ferment*.

Fungi (and especially species of *Saccharomyces*) and bacteria are the agents of fermentative processes or changes. Fermentation naturally ceases when the nutritive elements of the fermented substance are exhausted, or a sufficient proportion of a substance (as alcohol) deleterious to the ferment-organism is produced. It may be checked or altogether prevented by anything which prevents the growth of the organism, as by exclusion of the germs or spores, by subjection to a temperature too high or too low, by the presence of too large a proportion of sugar or of a substance (called an antiseptic) which acts as a poison to the organism. There are various kinds of fermentation, each of which is caused by special organisms. *Alcoholic fermentation* in saccharine solutions, or fermentation in its most restricted sense, may be produced

by any of several organisms, including several species of *Saccharomyces*, *Mucor*, *Penicillium*, and *Aspergillus*, and to a slight extent by certain other fungi; but the most important agent is *Saccharomyces cerevisiae*, which produces the fermentation of beer. In fermenting wine, several species of *Saccharomyces* are found. *S. Mycoderma* forms a mold-like growth on the surface, the so-called *flowers of wine*. *Aerobic fermentation* takes place in liquids which have undergone alcoholic fermentation, and is caused by *Micrococcus (Mycoderma) aceti*, the vinegar-plant. The alcohol is oxidized, and acetic acid or vinegar is the result. This micrococcus takes two forms: the immersed or anaerobic form exists as a mucilaginous mass called the *mother of vinegar*; the other is the surface or aerobic form, the *flowers of vinegar*. According to Pasteur, the latter only is active in producing fermentation. *Lactic fermentation*, or souring of milk, is induced by certain bacteria which decompose the sugar of milk and produce lactic acid. *Viscous fermentation* is of two kinds: the one is caused by certain bacteria which convert the fermenting substance into a slimy mass and produce manure; the other is caused by *Leuconostoc mesenteroides*, which brings about the slimy condition, but does not produce manure. The latter occurs in saccharine solutions, and is a source of serious loss to sugar-manufacturers on the European continent. The agent in *butyric fermentation* is *Bacillus amylobacter*, and butyric acid is the result. Certain fermentative changes are produced in wood by various fungi. *Putrefactive fermentation*, or putrefaction, occurs in animal substances and plant products containing a large proportion of nitrogenous matter. The organism which is active in the putrefaction of beef is *Bacterium termo*. The ammoniacal fermentation of urine is caused by *Micrococcus ureæ*. See *putrefaction*, *bacterium*, and *germ theory*, under *germ*.

Fermentation is a very general phenomenon. It is life without air, or life without free oxygen, or, more generally still, it is the result of a chemical process accomplished on a fermentable substance.

3. Figuratively, the state of being in high activity or commotion; agitation; excitement, as of the intellect or feelings, a society, etc.

a mortise in the steel breech-piece, and in the large caliber it is moved in and out by a translating screw on one side. The block is locked in position by a second screw having a part of its thread cut away so that a partial turn causes it to engage or disengage in the breech of the gun. The De Bange or Freire gas-check is generally used with this system of *fermeture*. The *fermeture* of the Hotchkiss mountain-gun consists of a simple prismatic wedge, with a locking screw engaging in a recess in the breech, and to lock it. This form of block has merely to support the head of the cartridge-case, which acts as its own gas-check. The *fermetures* for small-arms present a great variety of combinations and movements. The most important are the rotating breech-block, as in the United States Springfield and Martini-Henry rifles; the sliding breech-block, as in the Sharps and Winchester rifles; and the sliding bolt, as in the Hotchkiss and Chaffee-Reece rifles. In all modern small-arms the metallic cartridge-case serves as a gas-check or obturator. See *gas-check*, *interrupted screw* (under *screw*), *obturator*, and *cut under cannon*.

Some compare *Skt. parna*, wing, feather, leaf, tree (applied to various plants); the same connection of thought appearing in the *Gr. πτερόν*, a fern, πτερόν, a wing, feather, = *E. feather*.] One of a large group of vascular cryptogamous plants, constituting the natural order *Filices*. They are herbaceous, rarely shrubby or arborescent plants, sometimes with long creeping rhizomes. But in many cases the rootstock or caudex is erect, when the species is called a *tree-fern*. The fructification, which is asexual, consists of spores produced in sporangia upon the backs or margins of the fronds. The sporangia in most genera are collected in definite clusters (sori), and these are usually covered by a special covering membrane, or one formed from the margin of the frond, called an *indusium*. Each sporangium is formed from a single epidermal cell. In the largest suborder, the *Polypodiaceae*, the sporangia are stalked and provided with a vertical, many-jointed ring, which ruptures at maturity, allowing the escape of the spores. In the other suborders the ring is less perfectly developed, or wanting. The spores in germination produce a green prothallium upon the surface of the soil, and upon the under surface of the prothallium antheridia and archegonia are monously produced. After fertilization the germ-cell of the archegonium develops into a frond-bearing plant. About 2,500 species of ferns are known. They are found all over the world, but abound in humid temperate and tropical regions. Great Britain has about 50, temperate North America about 150, India about 600. Ferns are very abundant as fossil plants. The earliest known forms occur in Devonian rocks, and their remains are very common in connection with coal of the Carboniferous period. Plants of the related group *Ophioglossaceae* also are called ferns.

The word seems to have been applied by the Portuguese sailors and traders on the west coast of Africa to objects worshiped by the natives, which were regarded as charms or talismans.] 1. Any material object regarded with awe, as having mysterious powers residing in it or as

being the representative or habitation of a deity to which worship may be paid, and from which supernatural aid is to be expected. A

When the king (in Guinea) will sacrifice to *Fetisso*, he commands the *Fetissoero* (Pg. *feiticeiro*, sorcerer) to enquire of a Tree, whereto he ascribeth Diuinitie, what hee will do.

Purchas, Pilgrim-age, p. 651.

To class an object as a *fetish* demands explicit statement that a spirit is considered as embodied in it or acting through it or communicating by it, or at least that the people it belongs to do habitually think this of such objects; or it must be shown that the object is treated as having personal consciousness and power, is talked with, worshipped, prayed to, sacrificed to, petted or ill-treated with reference to its past or future behaviour to its votaries.
E. B. Tylor, Prim. Culture, II. 133.

Before experience had yet taught men to distinguish between the possible and the impossible, and while they were ready on the slightest suggestion to ascribe unknown powers to any object and make a *fetish* of it, their conceptions of humanity and its capacities were necessarily vague and without specific limits.
H. Spencer, Universal Progress, p. 66.

Hence—2. An object of blind devotion; an idol: as, gold has become his *fetish*.

fetichism (*fē'tish-izm*), *n.* [Also, after the French, *fetichism*, and sometimes *feticism*; = F. *fétichisme*; as *fetish* + *-ism*.] 1. The practice of worshipping a *fetish*; that form of religious belief and practice in which fetishes are the objects of worship. See the extracts.

The President de Brosses, a most original thinker of the last century, struck by the descriptions of the African worship of material and terrestrial objects, introduced the word *Fetichisme* as a general descriptive term; and since then it has obtained great currency by Comte's use of it to denote a general theory of primitive religion, in which external objects are regarded as animated by a life analogous to man's. . . . It seems to me . . . more convenient to use the word Animism for the doctrine of spirits in general, and to confine the word *Fetichism* to that subordinate department which it properly belongs to: namely, the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects. *Fetichism* will be taken as including the worship of "stocks and stones," and thence it passes by an imperceptible gradation into Idolatry. *E. B. Tylor*, Prim. Culture, II. 132.

Fetichism is almost the opposite of Religion; it stands towards it in the same relation as Alchemy to Chemistry, or Astrology to Astronomy, and shows how fundamentally our idea of a deity differs from that which presents itself to the savage. The Negro does not hesitate to punish a refractory *Fetish*, and hides it in his wall-cloth if he does not wish it to know what is going on. Aladdin's lamp is, in fact, a well-known illustration of a *Fetish*.
Sir J. Lubbock, Orig. of Civilisation, p. 349.

A latent *fetichism*, which is betrayed in that love of personification, or of applying epithets derived from sentient beings to inanimate nature, . . . is the root of a great part of our opinions.

Enmity; animosity; active hostility; a vengeful quarrel between individuals or parties; especially, hostility between families or parties in a state; a state of civic contention.

The natural issue of this (unreasonable desire) must be perpetual feuds and bickerings, contentions and struggles. *Bp. Atterbury, Sermons*, II. xviii.

The personal feuds and animosities that happen among so small a people might obstruct the course of justice. *J. Adams, Works*, IV. 306.

It was said that Francis and Hastings were notoriously on bad terms, that they had been at feud during many years, that on one occasion their mutual aversion had impelled them to seek each other's lives. *Macaulay, Warren Hastings*.

Ring out the feud of rich and poor,
Ring in redress to all mankind.
Tennyson, In Memoriam, cvi.

2. More specifically, an aggravated state of hostility, marked by frequent or occasional sanguinary conflicts, between one family or clan and another, to avenge insults, injuries, or murders inflicted by one party, or by any member of it, upon those of the other side; a vendetta.

Death of Percy Reed (Child's Ballads), VI. 143.

A glance at the early history of our national justice shows that its original groundwork was the right of feud. *J. R. Green*.

feud² (fūd), *n.* [*< ML. feudum*, also written *feodum* (whence the less proper *E. spelling feud*, *q. v.*), a feud, fief, fee; *< OHG. fihu*, *fēhu*, cattle (also prob., as in *AS. feoh*, etc., property in general): see *fee*¹. Hence (from *OHG.*) *OF. feu*, *fief*, *feu*, *fied* (whence *ME. fee*, *E. fee*², and, from *fief*, later *E. fief* and *seff*, *seoff*) = *Pr. feu* = *It. fo*, *fee*, *fief*: see *fee*², *fief*, *seoff*. The origin of the *d* in *ML. feudum* is uncertain; as the word was artificial, the *d* was perhaps a mere insertion to avoid the collocation *feu*; the reg. ML. reflex of the *OHG.*, etc., would be *feum*, which actually occurs in the *Doomsday Book*. *Feud*² and its derivatives are less prop. spelled *feod*, etc.] 1. In *feudal law*, an estate in land granted on condition of services to be rendered to the grantor, in default of which the land was to revert to the grantor; a fief; a tenure of land under and by dependence on a superior. The grantor or lord was entitled to the homage or fealty of the grantee or vassal. The estate was so called in contradistinction to *allodium*, which is an estate subject to no superior but the general law of the land.

Palgrave considers that the origin of feudal tenure may be traced to the grants made by the Romans to the barbarian *laeti* occupying the Limitanean or Riparian territories, upon the condition of performing military service. These donations or *feuds* descended only to the male heir of the donee, and could not be alienated to a non-military tenant. *W. K. Sullivan, Intro. to O'Curry's Anc. Irish*, p. cccxiii.

2. Land held in feudal tenure by a vassal.

The essential and fundamental principle of a territorial *feud* was, that it was land held by a limited or conditional estate—the property being in the lord, the usufruct in the tenant. *W. K. Sullivan, Intro. to O'Curry's Anc. Irish*, p. cccxiii.

Honorary feud, in *law*, a title of nobility descendible to the eldest son, exclusive of all the rest. — **Military feuds**, in Great Britain, the original feuds, which were in the hands of men who performed military duty for their tenures.

feudal¹ (fū'dal), *a.* [*< feud*¹ + *-al*.] Pertaining to or in the nature of a feud or partizan conflict.

feudal² (fū'dal), *a.* [Also written *feodal*; = *F. féodal* = *Sp. Pg. feudal* = *It. feudale* = *G. feudal*, etc., *< ML. feudalis*, feudal, a vassal, *< feudum*, a feud: see *feud*².] 1. Pertaining to feuds, fiefs, or fees; relating to or dependent upon the method of landholding called feud, fief, or fee: as, *feudal tenure*; *feudal rights* or services; a *feudal lord* or vassal.

The *feudal tenure*, which was certainly at first the tenure of servants who, but for the dignity of their master, might have been called slaves, became in the Middle Ages the tenure of noblemen.

The old *feudal spirit* which prompted a man to treat his tenants and vassals as part of his stock . . . had been crushed before the reign of Edward III. *Stubbs, Const. Hist.*, § 469.

2. Pertaining to the state of society under this system of tenure; characteristic of the relations of lord and vassal.

It is time . . . that we had a *feudal map* of England before the manorial boundaries are wiped away. *Stubbs, Medieval and Modern Hist.*, p. 64.

Feudal system, a system of political organization with reference to the tenure of land and to military service and allegiance prevalent in Europe in the middle ages. Its main peculiarity was that the bulk of the land was divided into feuds or fiefs, held by their owners on condition of the performance of certain duties, especially military services, to a superior lord, who, on default of such performance, could reclaim the land. This superior might be either the sovereign, or some subject who thus held of the sovereign, and in turn had created the fief by subinfeudation. According to the pure feudal system, the lord was entitled to the fealty of his tenants, but not to that of their subtenants, every man looking only to his immediate lord. On the continent of Europe, while the system was in full operation, this principle made the great lords practically independent of their nominal sovereigns, who could command their allegiance only through their self-interest or by superior force; and therefore kings were often powerless against their vassals. In England, however, the sovereign was always entitled to the fealty of all his subjects. Feudal tenures were abolished in England by act of Parliament in 1660, in Scotland in 1747, and in France at the revolution of 1789. In Germany, Austria, etc., they continued till after the revolutionary movements of 1848–50. In each case, however, they had long previously been much mitigated in their social and political effects. A feudal system prevailed in China from a very early period, but was brought to an end in 220 B. C., on the conquest of the whole country by Siang Wang of Tsin, known as Tsin-shi-Hwang-ti. The feudal system of Japan was abolished in 1871, when the daimios or barons surrendered their lands to the mikado. See *daimio*.

Feudalism was really a co-operative association for the mutual defence of the members. *F. Pollock, Land Laws*, p. 52.

feudalization (fū'dal-i-zā'shon), *n.* [*< feud*² + *-ation*.] The act of feudalizing or reducing to feudal tenure, or of conforming to feudalism.

'a trembling,' akin to Gr. *φείβομαι*, bee affrighted, *φόβος*, flight, panic fear, terror.] 1. In *pathol.* (a) A temperature of the body higher than the normal temperature, appearing as a symptom of disease; pyrexia.

The temperature of the body in health is between 98° and 99° F., and is maintained at this point by the adjustment of the production of bodily heat to its dissipation, both of these processes being largely under nervous control. During the period of invasion of the fever, or at any time when the temperature is rising, the heat produced exceeds the heat lost. If the rise is very rapid, the withdrawal of the blood from the skin, which diminishes the loss of heat, may give rise to a cold sensation or chill, which may be combined with an attack of shivering. By the latter the production of heat is increased. During fever the production of heat, while it may be greater than in a healthy body at rest, does not exceed what a healthy body can dispose of without experiencing increase of temperature.

The consumption of the tissues of the body in fever exceeds ordinarily the repair, and there is more or less emaciation; the excretion of urea is increased; the pulse is usually quickened as well as the respiration; the bowels are apt to be constipated; and thirst, loss of appetite, headache, and vague pains are commonly complained of. Fever is caused by zymotic poisons, by local inflammation, or by overheating as in sunstroke, and is sometimes of exclusively nervous origin. It is unquestionably injurious to the patient when it is excessive or too long continued; in some cases, where it does not exceed certain limits, it is very probably innocuous, or may even be advantageous. Fever would ordinarily be called slight up to 101° or 102° F., moderate up to 103° or 103.5°, and high above this. Temperatures above 105° F. would be called excessively high, and to such the name of *hyperpyrexia* is applied.

The limits of the significations of these terms are not precisely marked; they vary somewhat in the usage of different individuals. The prognostic significance of pyrexia depends on the accompanying conditions. (b) The group of symptoms consisting of pyrexia and the symptoms usually associated with it. (c) A disease in which pyrexia is a prominent symptom: as, typhoid fever, scarlet fever, etc.

For the *fevere* agn hath comonly alienacion of witt, and schewynge of thingis of fantasy.

Typical cases, after an incubation of from five to eight days, with only slight prodromata, suddenly develop a high fever which lasts from five to seven days, and as suddenly disappears. With the high fever are associated malaise, anorexia, pains in the head, back, and limbs, muscular hyperalgia, constipation or slight diarrhea, marked enlargement of the spleen, very frequent pulse, and a dirty-yellow complexion. The attack may recur after a week, and several such recurrences may take place. The mortality is from 2 to 4 per cent. For synonyms, see phrases above and below.—**Remittent bilious fever**. (a) Remittent fever. (b) Relapsing fever. After about one day the scarlet eruption appears, which lasts for three or four days in its original intensity, and then begins to fade out, when desquamation sets in. Among complications and consequences may be mentioned the formation of diphtheroid membranes in the throat, abscess of cervical lymphatic glands, inflammation of the ear, and acute inflammation of the kidneys. The contagion may preserve its vitality for months in clothes, bedding, carpets, etc. One attack usually protects against subsequent infection.—**Seasoning fever**, a mild form of (a) remittent fever; (b) yellow fever in new-comers.—**Septan fever**, intermittent fever in which the paroxysms recur on the seventh day (both paroxysmal days being counted).—**Sepetic fever**, the fever arising from ill-cared-for wounds, from the infection of the system with their morbid products or the bacterial germs flourishing in them.—**Seven-day fever**. in its features nor in the circumstances under which it arises disclosing its identity with other better-marked forms. Under the name are doubtless included actual practice many mild and abortive cases of typhoid, malarial, and other fevers, some cases of purely neurotic origin, and possibly some dependent on a distinct unknown zymotic cause. (2) A period of invasion of a week or less, characterized by a gradually increasing temperature, with morning remissions and evening exacerbations, want of appetite, thirst, dry and coated tongue, frequent pulse, headache, often nose-bleed, usually constipation, often slight diarrhea, slightly tympanic abdomen, with perhaps some tenderness and gurgling in the right iliac region, some enlargement of the spleen, perhaps slight delirium at night, and some bronchitis. (3) A period of continued pyrexia (fever) in which the temperature ceases to rise, and in which its daily variations are less. This period (astigium) lasts for a week or two. The want of appetite, thirst of tongue, frequent pulse, headache, and bronchitis continue or are increased. The tympanic spleen, enlargement, and delirium become more pronounced. Three or four soft yellow stools are passed daily. About the beginning of this period an eruption of small, pink, slightly raised spots appears on the skin, especially of the back and abdomen. (4) A period of defervescence, in which the fever gradually disappears and all the symptoms improve. This may last about a week. Cases vary much from this typical progress, and may be marked in addition by intestinal hemorrhage, perforation of the intestinal wall with collapse and peritonitis, thrombosis of the larger veins, especially the femoral, pneumonia, lobular and (rarely) lobar, or meningitis. Relapses (after a normal temperature has been reached) and recrudescences (before the fever has entirely disappeared) are not very uncommon. The mortality varies, but the average of recent reports is not far from 10 per cent. The main anatomical features are inflammation of Peyer's patches and of the solitary glands of the small and sometimes of the large intestine, with inflammation of the mesenteric lymphatic glands. Persons between fifteen and thirty years of age seem to be most frequently attacked. A previous attack produces a certain but not complete protection. The contagium seems to be given off from the sick mainly by the stools. The contamination of food and drink seems to be the most important mode of ingress. Personal contact does not materially increase exposure. Typhoid fever is now believed to be caused by a microscopic parasitic organism or bacillus, in length about one third the diameter of a red blood-corpuscle, in thickness about one third of its length, with rounded ends, mobile, forming spores at a temperature between 30° and 42° C., but not at lower temperatures, and forming minute brownish-yellow colonies on gelatin, which it does not soften. For synonyms, see phrases above.—**Typhomalarial fever**, a febrile disease produced by the simultaneous action of the typhoid and malarial poisons. The term more often indicates a doubt whether the case is malarial or typhoid.—**Typhus fever**, a contagious fever which in typical cases presents the following features: After an incubation of nine days or more, a sudden onset of fever, often with a chill, a period of continued fever with pains in the head, back, and limbs, dizziness, noise in the ears, frequent bronchitis, and enlarged spleen. An eruption appears on the third to the seventh day, in the form of small red spots, usually abundant over the trunk and limbs, which in two or three days more become hemorrhagic. In the second or third week the disease may terminate by a fall of temperature, which is usually quite rapid. Relapses are very rare. The mortality varies in different epidemics from 6 to 20 per cent. The most susceptible years are between the ages of twenty and forty. One attack affords considerable protection against a second. For synonyms, see phrases above.—**Urethral fever**, fever ensuing on an operation on the urethra, such as passing a catheter.—**Yellow fever**, an infectious disease of warm climates, typical cases of which present the following features: After a period of incubation varying from a day to several weeks, the invasion begins suddenly with headache, pains in back and limbs, often distinct chill, nausea, often vomiting, inactive bowels, fever (pyrexia) usually high, a pulse-rate less than corresponds to the pyrexia, sometimes vertigo, convulsions, delirium, and albuminuria. Following upon these symptoms, often after a lull and apparent beginning of recovery, may come exhaustion of the heart and nervous centers, bleeding from mucous membranes (giving rise to black vomit), jaundice, scanty urine, and albuminuria. The mortality in the better class of private cases varies in the experience of different observers from 7 to 10 per cent. The autopsy reveals, in addition to the hemorrhages, congestion of the nervous centers, hypostatic congestion of the lungs, fatty degeneration of the heart and liver, and parenchymatous nephritis. The infectious principle is not yet (March, 1889) identified. It is to be inferred from analogy that it is probably a ptomaine-producing bacillus. It infects localities. In its spread from place to place human intercourse seems to be the efficient factor. It may be carried in clothes and other goods. Its development is favored by filth and repressed by cold. Individuals are infected by being in an infected locality. Personal contact with the

sick does not seem to greatly enhance the exposure. Disinfection of food and drink is unavailing as a preventive measure. Whites are more susceptible to the disease than blacks, new-comers than old inhabitants. A previous attack usually produces immunity. Geographically it occurs in the warmer parts of America (though it has been known as far north as Portland in Maine), and in some parts of the old world.—**Yellow remittent fever**, ardent continued fever. (c) In a wide sense, not now current, any literary product of the imagination, whether in prose or verse, or in a narrative or dramatic form, or such works collectively.—5. In law, the intentional assuming as a fact of what is not such (the truth of the matter not being considered), for the purpose of administering justice without contravening settled rules or making apparent exceptions; a legal device for reforming or extending the application of the law without appearing to alter the law itself. Inasmuch as the courts cannot alter the law, but only declare it and apply it to facts ascertained by them, it was early discovered that the only way in which they could adapt the law to hard cases, or stretch it to new cases, was by pretending a state of facts to fit the rule of law it was thought just to apply. Thus it was a rule of law that a deed takes effect from delivery, and the courts had no power to alter this rule; but if a grantor fraudulently or negligently delayed delivering his deed at the time it bore date, and afterward sought to claim some unjust advantage, as having continued to be owner meanwhile, the courts, not being able to change the rule of law, would by fiction treat the delivery as relating back to the date. So, when legislation forbade transfers of land unless made publicly by record, the courts allowed an intending grantee to sue, alleging that the land belonged to him, and the intending grantor to suffer judgment to pass; thus by a fiction creating a mode of conveyance which, for all practical purposes, preserved the privacy of titles. Direct methods of improving the rules and forms of law have in recent times superseded the invention, and for the most part the use, of fictions.

I employ the expression "Legal Fiction" to signify any assumption which conceals, or affects to conceal, the fact that a rule of law has undergone alteration, its letter remaining unchanged, its operations being modified.

Ficus (fik'us), *n.* [L., a fig-tree, a fig: see *fig*.] 1. In bot., a very large genus of tropical and subtropical trees or shrubs, of the urticaceous tribe *Artocarpeæ*, characterized by bearing their minute unisexual flowers within a nearly closed globose or pear-shaped receptacle. The genus is remarkable for the peculiar arrangement by which cross-fertilization is effected through the agency of insects.

There are always three forms of flowers, the staminate, the pistillate, and a third, the gall-flower, which resembles the pistillate but is incapable of fertilization, and is usually occupied by the pupa of a species of *Blastophaga* or other hymenopterous insect. In a large group of species the three forms are found within the same receptacle; but in much the larger number, as in the common fig, the female flowers are in one receptacle and the male and gall flowers together in another. The perfect insect is formed synchronously with the maturity of the pollen of the male flowers, through which it makes its way and escapes by a perforation made at the apex of the receptacle. In what way it conveys the pollen to the pistillate flowers in the closed female receptacle is not understood, but it is believed that it is done, and that by this means only the female flowers are fertilized. Generally the barren and fertile receptacles are upon the same tree and are similar in appearance, but in the common fig they are upon separate trees, and differ so much in form that the sterile, known as the wild fig or caprifig, has been considered by many botanists as a species distinct from the other. There are about 600 species, the greater number belonging to the islands of the Indian and Pacific oceans, though there are a few in tropical America. Three or four species are found in Florida. The genus includes the common fig (*F. Carica*), the banian (*F. Bengalensis*), the india-rubber tree (*F. elastica*), etc. The wood is generally soft and valueless. See *fig* 2, and cut under *banian*.

Another derivation, *< L. fidicula*, commonly pl. *fidicula*, a small stringed instrument, a small lute or cithern (dim. of *fides*, a stringed instrument, a lute, lyre, cithern), hardly agrees with the Teut. and not at all with the Rom. forms.] 1. (d) In a scale, the fifth tone from the bottom; the dominant: solmized sol, as G in the scale of C, or E in that of A. The typical interval of the fifth is that between the first and fifth tones of a diatonic scale, acoustically represented by the ratio 3:2, and equal to three diatonic steps and a half. Such a fifth is called *perfect* or *major*; a fifth a half-step shorter is called *diminished* or *minor*; a fifth a half-step longer is called *augmented*, *pluperfect*, *superfluous*, or *extreme*. The perfect fifth is the next most perfect consonance after the octave. In harmony the parallel motion of two voices in perfect fifths is forbidden; such fifths are often called *consecutive fifths*, or simply *consecutives*.

warm temperate countries. It is a small tree, with large, rough, deciduous leaves, and a pyriform fruit, which varies much in size, color, and flavor, and of which two crops are usually borne each season. This fruit consists of a hollow, fleshy receptacle filled with a multitude of minute nutlets or so-called seeds, the ripened ovaries of the pistillate flowers which covered the interior.

Form, Conformation, Figure, Shape, Fashion.** Form is the general word; and its use in ordinary speech has been much influenced by its metaphysical meaning, so that it is the least geometrical of these words. When form refers to the outward, it generally suggests the substance of the person or thing whose form it is; form may also be used in opposition to spirit or substance: as, "a form of godliness," 2 Tim. iii. 5. Conformation is the result of the arrangement of the parts of a whole, and the word suggests the proportion and relation of the parts internal or external, to each other. Figure, shape, and fashion are external; the first is often, and the others are generally, the result of art. Figure has a wide range of meaning, from mere outline to pictorial or fictile representation. Shape has almost as much freedom of use; yet, having been little used as a learned term, it is more literally geometrical, and at the same time more loosely employed. Fashion in the sense of form is obsolescent.

figure-casting (fig'ūr-kās'ting), *n.* The art of preparing casts of human or animal forms and of various other complex objects. A figure is first accurately formed in wax, clay, plaster, or other suitable material, which serves as the core. If the core is fusible, or can be reduced to ashes, the mold is formed directly upon the core, and when it is perfectly dry and hard it is exposed to a heat sufficient to melt or incinerate the core, the removal of which leaves a cavity for the metal of the cast. This method gives a solid casting, and is therefore suitable for small work only; moreover, the model itself is destroyed by one use. Exquisite casts of natural objects are made in this manner. If the core cannot be removed in the way mentioned, the mold itself is made in parts to permit its removal.

Tanagra figurine, in archaeol., one of the small terracotta figures of divinities, of mortals, or of animals, found in various quantity and perfection throughout Greek lands.

These figures were in great demand among the Greeks as household ornaments, and it was usual to present them as offerings in temples, and to bury several of them with a dead body. They were, as a rule, cast in molds and then finished, often very delicately, by hand, and after the baking they were brilliantly colored. In them is preserved a charming memorial of Greek private life in its various phases, such as the games of the children and the occupations of the women. They are commonly known as Tanagra figurines, because those first brought into public notice, as well as some of the most beautiful examples since found, come from the cemetery of Tanagra in Boeotia.

Jer. Taylor, *Works* (ed. 1835), II. 352.

2. The establishment of a filial relation, specifically by adoption.

God hath forgot all these paternities, all these *filiations*, all these incorporatings, all these invincations of Israel into his own bosom, and Israel is become the generation of his wrath. *Donne*, *Sermons*, vi.

3. In law, the judicial determination of the paternity of a child, especially of a bastard; *affiliation*.

We are now sure that, if the principle on which Solomon decided a famous case of *affiliation* were correct, there can be no doubt as to the justice of our suspicion.

Macanlay, *Satler's Ref. Refuted*.

4. Any analogous close connection or relation.

Two of our English letters, *n* and *d*, are derived, in strict historical *filiation*, from two of the alphabetic signs . . . by means of which the name of King Sent is expressed. *Isaac Taylor*, *The Alphabet*, i. 61.

Everything tends to show that there is direct *filiation* between the rude workmanship of the flint of Saint-Acheul and the skilled workmanship of the flint of the neolithic age. *N. Joly*, *Man before Metals* (trans.), p. 29.

filibeg (*fil'i-beg*), *n.* [Also written *filibeg* and (improp.) *philibeg*, sometimes *filibag*; < *Gael. feileadh-beag*, the kilt in its modern shape, lit. 'small kilt' (*beag*, small, little), in distinction from *feileadh-mor*, the 'large kilt' (*mor*, large, great), the kilt in its primitive form, consisting of one piece, generally of tartan, covering, when spread, the whole body, and girt around the waist; *feileadh*, *feile*, the kilt, cf. *filicadh*, a fold, plait, < *fil*, v., fold.] A platted petticoat or skirt reaching only to the knees, worn by men in the Highlands of Scotland; a kilt.

flibuster (*fil'i-bus-tér*), *n.* [*< Sp. filibustero* (with inserted *i* in first syllable) (= *It. filibustiere*, < *F. filibustier*, earlier *frībustier*, a filibuster, bucaneer, freebooter (with *s* inserted, but orig. not pronounced — a common fact in 17th century *F.*, after the analogy of words in which an original *s* was retained in spelling, though it had become silent in pronunciation); < *D. vrijbouter* (Kilian, 1598), now *vrijbutter*, a freebooter, = *E. freebooter* = *Dan. frībytter* = *Sw. frībýtare* = *G. freibeuter* (the *E.*, *Dan.*, *Sw.*, and *G.* words being not independent formations, but formed after the analogy of the *D. vrijbouter*, which appears to be the oldest form). In a Dutch work ('*De Americaensche Zee-Rovers*, 1678) written by a bucaneer named John Oexmelin, otherwise Exquemelin or Esquemeling, and translated into French and Spanish, and subsequently into English (1684), the adventurers of the West Indies are said to have been divided into three classes — the bucanears (*boucaniers*) or hunters (see *bucanear*), the filibusters (*flibustiers*) or rovers, and the farmers (*habitans*); and the filibusters are said to have assumed their name "from the English word *flibuster*, which means rover"; this must refer to *E. freebooter*, but the *D.* form appears to be the original. The bucanears consisted mainly of French, Dutch, and English adventurers, and not to any extent of Spaniards, with whom they were constantly at war; the *Sp.* form *flibustero* can only be an accom. of the *F. flibustier*; the *s* is now pronounced in *F.*, etc., because, as now used, it is taken from the books, as spelled. The commonly assumed connection with *E. flyboat* (*Sp. flibote*, *flibote*, *F. flibot*, < *D. vlieboot*; see *flyboat*) has no support either in form or in historical fact.] 1. A freebooter; in history, a name distinctively applied to the West

Indian bucaneeers or pirates of the seventeenth century. See *bucaneer*. Hence—2. One of a band of men organized, in disregard of international law, for the purpose of invading and revolutionizing a foreign state. Specifically applied in history to the members of certain expeditions which in the middle of the nineteenth century originated in or set out from the United States against certain Spanish-American countries for the purpose of revolutionizing them. The principal of these expeditions were those led by Narciso Lopez from New Orleans against Cuba, in 1850–51, and those by William Walker from California against the Mexican state of Sonora in 1853–54, and against Nicaragua in 1855–58. Both leaders were captured and put to death, the latter after having succeeded in his second object and exercised sovereign power for some time over Nicaragua. Hence—3. In a legislative or other deliberative body, a member in the minority who resorts to irregular or obstructive tactics to prevent the adoption of a measure or procedure which is favored by the majority. S.]

The Democrats . . . *filibustered* and postponed the vote till a day when strength could be fairly measured on it.

They [Irish Nationalists] may, as some of the more actively bitter among them did in the Parliaments of 1874 and 1880, obstruct business by long and frequent speeches, dilatory motions, and all those devices which in America are called *filibustering*.

The Greek Church, on the contrary, has always maintained the doctrine of the single procession, as expressed in the original form of the Nicene Creed, in accordance with John xv. 26, "the Spirit of truth, which proceedeth from the Father"; and the controversy on this subject (called the *Filioque controversy*), continued to the present time, was one of the chief causes of the schism between the two churches.

= Sp. Pg. *filtro* = It. *feltro*, felt, < ML. *feltrum*, *filtrum*, felt: see *felt*, and cf. *felter*, v., *feuter*.]

1. A device for arresting and separating any matter mechanically suspended in a liquid. Filters used in the processes of analytical chemistry are made of paper or asbestos. The filter-paper is bibulous, consisting of nearly pure cellulose, with only bare traces of mineral matter. Many precipitates are more conveniently separated by an asbestos filter, the most common form consisting of an ordinary platinum crucible having the bottom perforated with fine holes and covered with a thin asbestos felt. In the arts filters are used to purify water, syrups, vinegar, the juices of cane and fruits, oils, liquors, sewage, liquid by-products, and molten metals. The materials used in filtration are gravel, sand, charcoal, bone-black, sponge, fabrics, woven wire netting, asbestos, porous brick and stone, mineral wool, rope, paper, and powdered glass. The devices used to hold the straining material are in a great variety of forms, from a simple wick or loose cloth hung over the edge of a bowl of water and acting as a capillary strainer, to a settling-pond filtering 400,000 gallons of water in a day. The most common filter is a cone of bibulous paper, or a square of cloth sewed together to form a bag (called *Hippocrates's sleeve*). Filters also consist of porous brick or stone partitions, as in a cistern, or vessels partly filled with sand and gravel, or tubes filled with sponge, charcoal, or sand, etc. Domestic filters are used in connection with pumps and water-faucets. To cause the liquid to pass through a filter, the weight of a column of water, the pressure of the atmosphere, mechanical force from a screw or from steam-pressure, and centrifugal force are employed, as in the centrifugal filter, oil-filter, vacuum-filter, and many forms of pressure-filters. Filters are also made reversible and intermittent, so that the filtering material may be freed from the collected sediment. In some pressure-filters the liquid or syrup is within a cylinder, and is forced outward through rings of fabric under steam-pressure; in others it is forced through a series of strainers piled one above another. Where bone-black and charcoal are used, there is also a filtering or straining of a certain amount of gas and organic material that would be carried away by the filter without detention. Filters are also used to remove dust and floating matter from air, but such devices are more properly termed *air-strainers*.

Having for trial-sake filtered it through cap-paper, there remained in the *filtré* a powder of a very deep and lovely colour. Boyle, Works, I. 365.

and *pin*.] 1. An extension from the body of an aquatic animal, which serves for propelling, steering, or balancing in the water, and is developed from various parts of the body, generally as an alate or wing-like organ; a *pinna*. (a) In fishes there are unpaired or vertical and paired or horizontal fins. The former are dorsal, anal, or caudal. The paired fins are pectoral and ventral, the former homologous with the anterior member or manus (hand) of terrestrial vertebrates, the latter homologous with the posterior member or pes (foot). The relations of the spinous and soft portions of the dorsal and anal fins, and the position and structure of the ventral fins, as well as various other modifications of all the fins, have been much utilized for the classification and discrimination of groups in ichthyology. The names of the fins are commonly abbreviated A., C., D., P., V., as in the accompanying figure. In the lower fishes the fins are sustained in an erect position by numerous filamentary or slender rods (actinotrichia), but in the typical fishes there is a growing together of the actinotrichia into special rays or spines. In various forms (*Nematognathus*, *Salmoidae*, etc.) there is likewise a pocket-like sac or ridge on the hinder part of the back, generally consisting of adipose matter and called an adipose fin. (b) In cetaceans and sirenians the caudal (and if present) the dorsal fins are simply extensions of integument and soft tissues without any skeletal framework, while the pectorals are homologous with the anterior limbs of quadrupeds, having the same bones concealed in the outgrown integument; but there are no outward indications of hind limbs as fins. (c) In seals and other aquatic carnivorous mammals the fore and hind limbs, more or less involved in the common integument, constitute fins or flippers. (d) In various aquatic reptiles there are fins like those of cetaceans, being either tegumentous expansions or pectoral limbs, or both; and pelvic limbs are also often present in the form of fins. (e) In aquatic batrachians, adult or larval, the tail is usually a fin, as that of the tadpole. (f) In birds the reduced and peculiarly modified wings of penguins constitute fins. (g) In numberless invertebrates some extended or expanded part or organ of the body, of no determinate homology, serves as a swimming-organ, and so constitutes a fin, as the expansion of the foot of a pteropod. See *pinna*, *flipper*.

D, first dorsal; D', second dorsal; P, pectoral; V, ventral; A, anal; C, caudal.

(c) Determining completely the rights of the parties, so that no further decision upon the merits of the issues is necessary: as, a *final* judgment or decree—that is, one that is ready for execution, or for review by an appellate court, as distinguished from an interlocutory judgment or decree, or one that is preliminary to a further hearing and decision on details, before its execution or review by appeal.—**Final close**, in music, a concluding cadence.—**Final diameter**. See *tactical diameter*, under *diameter*. —For *final*, finally. Chaucer.—Syn. *Final*, *Eventual*, *Ultimate*, *Conclusive*. *Final*, coming at the end or at last, marks mainly the circumstance of being the last or at the last. *Eventual* has reference rather more to the outcome of events. *Ultimate* is like *eventual* in that respect: an ultimate object is that to which all one's actions tend as their aim and crowning point; in this sense it is a sort of superlative, with *ulterior* as the corresponding comparative. *Conclusive*, like *decisive*, is active; it means final by closing or settling, putting a stop to any further question or procedure: as, a *conclusive* argument, step, decision.

finite (fī'nit), *a.* and *n.* [= *F. fini* = *Sp. Pg. It. finito*, < *L. finitus*, *pp.* of *finire*, end, complete, finish: see *finish*. Cf. *finē*², *a.*, ult. a doublet of *finite*.] **I. a.** **1.** Not too great nor too small to be naturally susceptible of measurement, whether measurable by us or not; not infinite nor infinitesimal. All objects of ordinary experience are finite; God, eternity, immensity, and the like are not finite. Etymologically, *finite* means having an end or terminal; but this signification is not coextensive with the English use of the term. Thus, the circumference of a circle has no ends, yet is finite; while past time has an end, yet is not finite. So, if a finite arc be cut out of a parabola, what remains has two ends, yet is not finite.

The obvious portions of extension that affect our senses carry with them into the mind the idea of *finite*; and the ordinary periods of succession whereby we measure time and duration, as hours, days, and years, are bounded lengths.

Locke, *Human Understanding*, II. xvii. 2.

The following are the special significations of the word: (a) As applied to a class or integer number, capable of being completely counted, this is the fundamental meaning. This distinction between a finite and an infinite class is very important, because there is a peculiar mode of reasoning, called by logicians reasoning by transposed quantity, which is applicable to finite classes alone. The following syllogism is an example: "Every Hottentot kills a Hottentot; but no Hottentot is killed by more than one Hottentot; hence, every Hottentot is killed by a Hottentot." If by the Hottentots is here meant a class of which a complete census might be taken, this conclusion must be true, provided the premises are true. But if the generations of Hottentots are overlasting, each Hottentot might kill one of his children, and yet some Hottentots might die natural deaths. Reasoning by transposed quantity is indispensable in the higher arithmetic and algebra; and consequently in these branches of mathematics the distinction between finite and infinite classes is very important. (b) As applied to continuous quantity, smaller than a suitably chosen finite number multiplied into the unit of measurement, and larger than a suitably chosen finite number divided by the unit of measurement.

ing a negative particle, as *man*, opposed to *not-man*; also, a proposition containing only finite terms. (b) In *math.*, an integral is said to be expressed in *finite terms* when it is expressed without resort to an infinite series, although it may be expressed by means of exponential, elliptic, or Abelian functions which are synonymous with infinite series; but frequently expressions involving higher kinds of functions than the exponential and trigonometric are excluded.

2. An engine designed to throw a continuous stream of water through a hose upon a conflagration, for the purpose of extinguishing it.

Fire-engine.

Fire-engines are of three principal kinds: *hand-power*, *steam*, and *chemical*, according to the power employed. Hand-power fire-engines consist in the main of a pair of single-acting force-pumps, mounted on wheels, and worked by hand. They have been generally superseded by the application of steam. Steam fire-engines consist essentially of a pair of single-acting suction- and force-pumps operated by steam, the whole apparatus being mounted on wheels and drawn by horses, or sometimes self-propelled. The chemical fire-engine is a large form of fire-extinguisher mounted on wheels and drawn by horses. Floating fire-boats and steam fire-engines are used in large ports, for the protection of shipping and the water-fronts.

fire-escape (fir'es-kāp'), *n.* Any apparatus or structure designed to enable persons to escape from the upper windows of a building in case of fire. Portable fire-escapes consist generally of ladders, often mounted on wheels for ease in transportation, and capable of being extended like a telescope; permanent fire-escapes consist usually of light iron ladders and landings attached to the outside of a building.

fire-extinguisher (fir'eks-ting'gwis-ēr), *n.* An apparatus designed for immediate and temporary use in putting out a conflagration by means of a small stream of water or of water mingled with carbonic-acid gas. In the commonest form water is placed in a metal holder or vessel, and above it, within the holder, is placed a smaller vessel containing a chemical, as sulphuric acid, that may be set free by the turning of a handle or screw on the outside of the apparatus. Another chemical, commonly sodium bicarbonate, is also placed in the apparatus. When the acid is set free it combines with the sodium, setting free carbonic-acid gas, which, by its pressure, escapes when a nozzle is opened, carrying the water with it in a strong stream. Such extinguishers are usually made portable, to be carried in the hand or upon the back, or are mounted upon a light truck to be drawn by a horse; but they are also made in heavier forms, when they are commonly called *chemical fire-engines*.

Its larva lives in the ground, feeding on earthworms and soft-bodied insects, and transforms to the pupa in an oval earthen cell in June, issuing as a beetle ten days later. In the genus *Photuris* the larva is luminous. The larger tropical fireflies belong to the elaterid genus *Pyrophorus*, and are known as *cucujids*. One of the most brilliant is *P. noctuivorus* of South America and the West Indies, emitting such luminosity from two eye-like fe-

fire-pot (fir'pót), *n.* 1. A vessel used in ancient warfare to contain combustible fluid, and dropped from the walls or thrown from a military engine. Compare *fire-mace*.—2. That part of a furnace in which the fire is made.—3. A solderer's furnace.—4. A crucible.

fire-proof (fir'próf), *a.* Proof against fire; so constructed or protected as to be incombustible. Buildings are rendered fire-proof by the exclusive use in their construction of non-combustible materials, as stone, brick, iron, cement, concrete, and asbestos. In the case of textile fabrics, as cotton and linen, the means adopted is saturation with various salts, as borax, which leave their crystals in the substance of the fabric. Wood is best protected by silicate of soda, which on the application of strong heat fuses into a glass, and, not only enveloping the outside, but also filling the internal pores of the wood, shields it from contact with the oxygen of the air. All that can be done to protect combustible materials by any process, however, is the prevention of conflagration; no process yet known can prevent smoldering.

fireproof (fir'próf), *v. t.* [*< fire-proof, a.*] To render proof against fire by some protecting cover, by chemical treatment, or by construction with incombustible materials.

fireproofing (fir'pröf'ing), *n.* [Verbal *n.* of *fire-proof, v.*] 1. The act of rendering fire-proof: as, the *fireproofing* of cloth.

fire-raising (fir'rā'zing), *n.* The act of setting on fire. In Scots law, *fire-raising* is the technical equivalent of arson in English law. See *arson*.

"But we'll see if the red cock craw not in his bonnie barn-yard ae morning before day-dawning."

"Hush! Meg, hush! hush! that's not safe talk."

"What does she mean?" said Mannerling to Sampson, in an undertone.

That hadde a *fyrrred* cherubynes face.

Chaucer, *Gen. Prolog.* to C. T., l. 624.

fire-regulator (fir'reg'ū-lā-tór), *n.* An automatic device employed with low-pressure steam-heating furnaces to maintain a uniform temperature. It consists essentially of an expanding valve, which opens when the steam reaches a certain pressure, lifting a lever which in turn controls a damper in the chimney.

The closing of the damper checks the fire, when the pressure falls and the damper opens again, the process being continually repeated, and thus maintaining the temperature within certain limits.

fire-roll (fir'ról), *n.* *Naut.*, a peculiar beat of the drum to order men to their stations on an alarm of fire; a summons to fire-quarters; in the United States navy, the rapid ringing of the ship's bell as an alarm-signal of fire.

Specifically—(a) A standing frame supporting a surface of panel-work, textile fabric, or glass, the last of which allows the fire to be seen, while keeping off the heat. (b) A piece of stuff hanging from the edge of the mantelpiece or from a bracket or an arm, generally of light metal-work. (c) A screen, not unlike a fan, small enough to hold in the hand.

2. A woollen screen placed in the passageway from a powder-magazine whenever this is opened.

fire-setting (fir'set'ing), *n.* Excavation in a mine with the preliminary aid of a fire built against the working-face. Now almost an obsolete process, but before the application of gunpowder to mining purposes a method of the greatest importance. The rock, after being highly heated, is rapidly cooled by throwing cold water on it, by which it is so much cracked that it can be broken down by pick and gad.

fire-shield (fir'shêld), *n.* A sheet-metal guard used to protect workmen at a furnace or firemen at a fire from the heat. In an improved form two sheets of corrugated iron are riveted together at the edges, and connected at the top with a hose bringing water under pressure. The water fills the screen and escapes below. Hung on an elevated track before a furnace-door or suspended from a crane, it serves to absorb the heat from the furnace, and to keep the fire-room cool. When not required, it is rolled aside or lifted by the crane.

fire-ship (fir'ship), *n.* A vessel freighted with combustibles and explosives and set adrift, for the purpose of burning or blowing up an enemy's ships, a bridge, or other object.

Nym and Bardolph are sworn brothers in flitching, and in Calais they stole a *fire-shovel*: I knew, by that piece of service, the men would carry coals. *Shak.*, Hen. V., III. 2.

fireside (fir'sid), *n.* and *a.* 1. *n.* The side of the fireplace; the hearth; the space about a fire or hearth, considered especially as the place where a family gathers for social enjoyment.

fire-spirit (fir'spir'it), *n.* The spirit or deity supposed in some systems of religion to be the animating principle of fire; fire personified.

The *Fire-spirit* has great influence with the winged aerial supreme deity, wherefore the Indians implore him to be their interpreter, to procure them success in hunting and fishing, fleet horses, obedient wives, and male children. *E. B. Tylor*, Prim. Culture, II. 253.

fire-spot (fir'spot), *n.* In *archæol.*, a bowl-shaped hollow in the earth, partly filled with ashes, calcined bones, etc., and apparently used as a fireplace. By some, fire-spots are thought to be the vestiges of funeral pyres. They are common in the north of Europe, especially in Scandinavian countries.

fire-steel (fir'stêl), *n.* [(*<* D. *vuurstaal* = G. *feuerstahl* = Dan. *fyrstaal*) < *fire* + *steel*. Cf. *fire-iron*.] A steel used with a flint for striking fire.

rious parts of the world for obtaining fire by friction, or rubbing of one stick against another, either with the hands simply or with the aid of the drill.

A stone which resists the action of fire; especially, a kind of sandstone used in fireplaces: same as *malin-rock*.—4. An incendiary composition employed to set fire to ships, buildings, etc. It is made of niter, sulphur, salimony, and rosin, mixed with melted tallow and turpentine. The melted mixture is cast in paper molds and primed with a fuse. For use it is charged in shell together with a bursting-charge.

fire-surface (fir'êr'fäs), *n.* In steam-boilers, the aggregate surface of the boiler exposed to the action of the fire. Also called *heating-surface*.

A tower from which to watch for the outbreak of fire in a city, and to give the alarm by the ringing of a bell: now generally superseded by the fire-telegraph.

fire-trap (fir'trap), *n.* A place or building specially combustible, in which life is greatly exposed to destruction by fire.

While searching for *fire-traps* among the theaters, why not take a look at the churches and school-houses?

2. A contrivance of inflammable and explosive materials combined in various proportions, for the purpose of producing in combustion beau-

tiful or amusing scenic effects, or to be used as a night signal on land or sea, or for various purposes in war: commonly used in the plural.

The basis of these compositions consists of potassium chlorate, niter, sulphur, and charcoal, pulverized, and combined in different proportions with other agents which have the quality of imparting color to the flame (as with copper sulphate for blue, strontium nitrate or carbonate for red, potassium salts for violet, sodium salts for yellow, barium carbonate or nitrate for green), and with iron- and steel-filings to produce brilliant scintillations. These compositions are packed in cases of paper and pasteboard, generally cylindrical, the processes of packing and finishing demanding much skill and care. For scenic displays, the forms of fireworks most in use are the *fixed fires*, such as theater-fires, lances, and gerbes; *rotating fires*, as pin- or catharine-wheels, spiral wheels, etc.; *ascending fires*, as sky-rockets and girandolles; Roman candles; etc. As night signals or as incendiary projectiles, various pyrotechnic devices have been employed with success in military and naval operations. These devices consist of preparations used (1) in the service of cannon or cannon-ammunition, such as slow-match, quick-match, friction, electric, and obdurate primers, port-fires, and fuses; (2) for signals, such as signal-rockets, signal-lights, blue lights, etc., with their decorations consisting of stars, serpents, gold rain, rain of fire, and marions; (3) for incendiary purposes, as the carcass, incendiary match, and fire-stone; (4) for light, as tarred links, torches, light-balls, fire-balls, pitched fascines, and parachute-shells; (5) for offensive and defensive purposes, as bags of powder, petards, projectile rockets, as those of Congreve and Hale, light-barrels, and dynamite or nitroglycerin cartridges. The most familiar of the many forms of fireworks is the sky-rocket, whether employed as a signal or for mere display, or as a projectile in war. An important use of the rocket is that of a line-carrier to establish communication between a wrecked vessel and the shore. The Chinese, if not the actual inventors of fireworks, were the first to use the rocket as a missile in war, and the pyrotechnic exhibitions of the Chinese and Japanese still surpass those of all other peoples in ingenuity and splendor. The Japanese have contrived an exhibition of fireworks by daylight, consisting of bombs which, exploding high in air, discharge jets or volumes of colored smoke which take the forms of birds, fishes, trees, and even of human beings. Fireworks are supposed to have been introduced into Europe by the Italians. They are mentioned in a description of a pageant at the marriage of Henry VIII. and Anne Boleyn.

The king would have me present the princess . . . with some delightful ostentation, or show, or pageant, or antic, or *firework*.

Shak., L. L. I., v. 1.

All the hammocks were taken down, our ordnance loaded, and our powder-chests and *fireworks* made ready.

Winthrop, Hist. New England, I. 7.

I have seen the fireflies and *fire-worms*.

Byron, Cain, II. 1.

fire-worship (fir'wêr'ship), *n.* The worship of fire, or of the god of fire, or of the divine as typified by fire; also, the ceremonial cult of a public or a family hearth, as practised, for instance, by all Aryan peoples, by all ancient Greek communities, by the vestal virgins of Rome, and in each ancient Greek and Roman family. The term *fire-worship*, as specifically applied to the religion of the ancient Persians taught by Zoroaster, and practised by their descendants, the Guebbers and Parsis of Persia and India, is, if taken literally, a misnomer derived from the Mohammedans, the fire being with these peoples merely a symbol of divinity and a visible sign of their religion. See *Gueber* and *Parsi*.

Fire-worship brings into view again, though under different aspects and with different results, the problems presented by water-worship. The real and absolute worship of fire falls into great divisions, the first belonging rather to fetishism, the second to polytheism proper, and the two apparently representing an earlier and later stage of theological ideas. *E. B. Tylor*, Prim. Culture, II. 251.

After vanquishing Moab and Ammon, both nations addicted to *fire-worship*, he [David] showed no trace of mercy towards them.

Von Ranke, Univ. Hist. (trans.), p. 47.

fire-worshiper (fir'wêr'ship-êr), *n.* A worshiper of fire; specifically, a follower of Zoroaster. See *Gueber* and *Parsi*.

There has been an error in imagining that the Persians and the ancient *fire-worshipers* were idolaters simply of fire, inasmuch as, in bowing down before it, they simply regarded Fire as a symbol, or visible sign, or thing placed as standing for Deity. *H. Jennings*, Rosicrucians, p. 79.

The so-called *Fire-worshipers* certainly do not worship the fire, and they naturally object to a name which seems to place them on a level with mere idolaters.

Max Müller, Chips, I. 169.

When he was seven years old, all the kindred of his father's house, and all the friends thereof, assembled in the inner temple to see the high-priest invest him with the symbolic raiment of the *fire-worshiper*, "the garment of the good and beneficial way."

J. W. Palmer, *The New and the Old*, p. 273.

firing (fir'ing), *n.* [Verbal *n.* of *fire*, *v.*] 1. The act of applying fire or of making a fire for any purpose; specifically, the method of treating a furnace with regard to the use of fuel: as, hard *firing* (supplying fuel frequently and urging the fire); light *firing* (moderate supplies of fuel at frequent intervals); steady *firing*; heavy *firing*.—2. Fuel; fire-wood or coal.

3. The exposing of any material to high temperatures to burn, bake, etc.: as, the *firing* of painted glass to fix the colors; the *firing* of porcelain to melt and fix the glaze.

When the "withering" is finished, then follows the *firing*. The tea is placed in metal pans, set in a brickwork furnace, heated to a temperature of 240° or 250°; the leaves are turned incessantly . . . to prevent their burning . . . they are then removed, . . . thrown on tables, and rolled and sifted while hot.

A. G. F. Eliot James, *Indian Industries*, p. 345.

firkery (fêr'kêr-i), *n.*; pl. *firkeries* (-iz). [*firk*² + *-ery*.] A trick; a prank. [Prov. Eng.]

firkin (fêr'kin), *n.* [*OD. *wierken* (not found) (cf. *ODan. firik*, a farthing, *firken*, a multiple of four), < *D. vier*, = *E. four*, + *-ken*, *E. -kin*. Cf. *kilderken*, a measure of two firkins, also of *D. origin*.] 1. A measure of capacity, usually the fourth part of a barrel, and varying in magnitude with the barrel. The English ale and beer firkin is 9 imperial gallons, equal to 10.8 United States gallons; but at the time when ale- and beer-measures were distinct a firkin of beer was 9 gallons, while a firkin of ale was only 8 gallons. A firkin of honey was also 8 gallons, by a statute of 1581. A firkin of butter is 56 pounds (36 Geo. III.). A firkin of soap is 64 pounds or 8 gallons. The oldest firkins were of much greater capacity. Thus, by a statute of 1423 the firkin was 84 gallons; while by another of 1482 the firkin of fish was made 21 gallons, being one fourth of a butt and half a barrel. An Irish firkin was half a barrel or 100 pounds.

The standards, from 1621, were the Linlithgow firlots. The wheat firlot, used for wheat, rye, peas, beans, salt, grass-seed, etc., contained 2½ Scottish pints, or 2.197½ cubic inches, equal to 1½ Winchester bushels. The barley firlot, used for barley, oats, fruit, potatoes, etc., contained 31 Scottish pints, or 3.205½ cubic inches, equal to 1½ Winchester bushels. But the firlots in actual use were from 1 to 7 per cent. larger than the standards. The firlot was also used in the Isle of Man.

[The Hebrew word *rakia*, which is so rendered in Scripture, conveys chiefly the idea of expansion, although that of solidity is also suggested, inasmuch as the root signification of the word is 'that which is expanded by beating out.' The English *firmament* is adopted from the Latin *firmamentum*, which is the equivalent of the Greek *στερεώματα* (< *στερεός*, firm, solid), by which the writers of the Septuagint rendered *rakia*. Some old astronomers identified the firmament with the orb of the fixed stars; but the word never had any settled and exact meaning in astronomy.]
